## Abstract

A set of routines to compute the magnetic vector potential and magnetic field of two types of current carriers is presented. The (infinitely thin) current carrier types are a straight wire segment and a circular wire loop. The routines are highly accurate and exhibit the correct asymptotic behavior far away from and close to the current carrier. A suitable global set of test points is introduced and the methods presented in this work are tested against results obtained using arbitrary-precision arithmetic on all test points. The results are accurate to approximately 16 decimal digits of precision when computed using 64 bit floating point arithmetic, with few exceptions where accuracy drops to 13 digits. These primitive current carrier types can be used to make up more complex arrangements, such as a current along a polygon (by means of defining straight wire segments from point to point along the polygon) and a multi-winding coil with circular cross-section (by positioning circular wire loops at appropriate positions in the coils cross-section). Reference data is provided along with the code to compute it for testing the reader's routines against this work.

*Keywords:* magnetostatics; Biot-Savart; straight wire segment; circular wire loop; magnetic vector potential; magnetic field

## PROGRAM SUMMARY

*Program Title:* Accurate Biot-Savart routines with Correct Asymptotic Behavior  
*CPC Library link to program files:* (to be added by Technical Editor)

---

\*Corresponding author.  
*E-mail address:* jonathan.schilling@ipp.mpg.de

*Developer's repository link:* <https://github.com/jonathanschilling/abscab>

*Code Ocean capsule:* (to be added by Technical Editor)

*Licensing provisions:* Apache-2.0

*Programming language:* C, Python, Java, Fortran

*Supplementary material:* Reference output data for all methods described in this article.

*Nature of problem:*

A common task in computational physics is to compute the magnetic field and magnetic vector potential originating from current-carrying wire arrangements in the form of coils and cables. These current carriers can be approximated for computational simplicity as infinitely thin filaments following the center lines of the real current carrier. A current carrier path specified by a list of points along the path can be modeled as a set of straight wire segments from point to point along the polygon describing the current carrier geometry. Closed circular wire loops appear as well in practise and can be chosen to model, e.g., individual windings in a circular coil. Computational methods are thus needed to compute the magnetic field and the magnetic vector potential of a single straight wire segment or a single circular wire loop in order to model more complex current carrier arrangements by superposition of the current carrier primitives.

*Solution method(approx. 50-250 words):*

Analytical expressions are derived in this work to accurately compute the magnetic field and the magnetic vector potential of a straight wire segment and a circular wire loop. The expressions consist of several special cases, which are switched between depending on the location of the evaluation location in the coordinate system of the current carrier primitive. This approach allows to select the most accurate formulation for a given evaluation location and make explicit use of simplifications in certain special cases for the sake of simplicity, speed and accuracy. Particular attention was paid to make sure that the expressions presented in this work obey the correct asymptotic behavior for evaluation locations far away from and close to the current carriers.

*Additional comments including restrictions and unusual features (approx. 50-250 words):*

For most test cases, the full relative accuracy of the floating point arithmetic chosen for implementation is retained throughout the computations (16 digits of precision in the `float64` implementation), with few exceptions where accuracy drops by up to 2 digits of precision (in the `float64` case). The provided implementations have not been optimized for speed.

## 1. Introduction

A common task in computational physics is to compute the magnetic field and magnetic vector potential originating from current-carrying wire arrangements in the form of coils and cables. These current carriers can be approximated for computational simplicity as infinitely thin filaments following the center lines of the real current carrier. A current carrier path specified by a list of points along the path can be modeled as a set of straight wire segments from point to point along the polygon describing the current carrier geometry. Closed circular wire loops appear as well in practise and can be chosen to model, e.g., individual windings in a circular coil. Computational methods are thus needed to compute the magnetic field and the magnetic vector potential of a single straight wire segment or a single circular wire loop in order to model more complex current carrier arrangements by superposition of the current carrier primitives. Analytical expressions are derived in this work to accurately compute the magnetic field and the magnetic vector potential of a straight wire segment and a circular wire loop. The expressions consist of several special cases, which are switched between depending on the location of the evaluation location in the coordinate system of the current carrier primitive. This approach allows to select the most accurate formulation for a given evaluation location and make explicit use of simplifications in certain special cases for the sake of simplicity, speed and accuracy. Particular attention was paid to make sure that the expressions presented in this work obey the correct asymptotic behavior for evaluation locations far away from and close to the current carriers. For most test cases, the full relative accuracy of the floating point arithmetic chosen for implementation is retained throughout the computations (16 digits of precision in the `float64` implementation), with few exceptions where accuracy drops by up to 2 digits of precision (in the `float64` case). The provided implementations have not been optimized for speed.

The magnetic field is denoted by  $\mathbf{H}$  and the magnetic flux density  $\mathbf{B}$  is then given by  $\mathbf{B} = \mu_0 \mu_r \mathbf{H}$ , where  $\mu_0$  is the vacuum magnetic permeability and  $\mu_r$  is the relative permeability, taking material properties into account. In the field of plasma physics generally and in this work in particular, these two terms are frequently used synonymously due to the vanishing magnetic susceptibility  $|\chi| \ll 1$  of the plasma, leading to  $\mu_r = 1 + \chi \approx 1$ . This is equivalent to considering only vacuum magnetic fields. Then, magnetic field and magnetic flux density only differ by a factor of  $\mu_0$ .

## 2. Methods

In this section, accurate methods used to compute the magnetic vector potential and the magnetic field of a straight wire segment and a circular wire loop are presented. Furthermore, methods to evaluate the magneto-static quantities in global coordinates are provided. The section is concluded by a description of the verification procedure employed to benchmark these methods.

### 2.1. Straight Wire Segment

The straight wire segment is handled first. The basic geometry of a single wire segment is shown in Fig. 1.

Figure 1: Geometry of a single wire segment after Fig. 1 in Ref. [1]. A cylindrical coordinate system  $(\rho, \varphi, z)$  is aligned with the wire segment (red line), such that the wire is aligned with the  $z$ -axis and starts at the origin. A current  $I$  flows along the wire segment of length  $L$  in positive  $z$  direction (red arrow). The evaluation point is specified by  $\mathbf{x} = (\rho, \varphi = 0, z)$ .  $R_i$  ( $R_f$ ) denotes the distance from the start (end) of the wire segment to the evaluation location. The angles  $\alpha$  and  $\beta$  are used in the formulas below.

#### 2.1.1. Magnetic Vector Potential

The magnetic vector potential of a straight wire segment only has component  $A_z$  parallel to the wire:

$$\mathbf{A} = A_z \hat{\mathbf{e}}_z. \quad (1)$$

It is given by:

$$A_z(\rho, z) = \frac{\mu_0 I}{4\pi} \ln \left( \frac{1 + \epsilon}{1 - \epsilon} \right) \quad (2)$$

with

$$\epsilon = \frac{L}{R_i + R_f} \quad (3)$$

$$R_i = \sqrt{\rho^2 + z^2} \quad (4)$$

$$R_f = \sqrt{\rho^2 + (1 - z)^2}. \quad (5)$$

In this work normalized coordinates  $\rho' = \rho/L$  and  $z' = z/L$  are used. This leads to the following expressions for  $r_i = R_i/L$  and  $r_f = R_f/L$ :

$$r_i = \sqrt{\rho'^2 + z'^2} \quad (6)$$

$$r_f = \sqrt{\rho'^2 + (1 - z')^2} \quad (7)$$

$$\Rightarrow \epsilon = \frac{1}{r_i + r_f}. \quad (8)$$

A common prefactor depending on the current  $I$  and  $\mu_0$  is split off:

$$A_z(\rho', z') = \frac{\mu_0 I}{2\pi} \tilde{A}_z(\rho', z') \quad (9)$$

with

$$\tilde{A}_z(\rho', z') = \frac{1}{2} \ln \left( \frac{1 + \epsilon}{1 - \epsilon} \right) = \text{atanh}(\epsilon). \quad (10)$$

The rest of this section is dedicated to the accurate computation of  $\tilde{A}_z(\rho', z')$ . One of several formulations is chosen depending on the evaluation location  $(\rho', z')$ :

$$\tilde{A}_z(\rho', z') = \begin{cases} \tilde{A}_{z,\text{ax}}(z') & : \rho' = 0, \text{ any } z' \\ \tilde{A}_{z,\text{rad}}(\rho') & : \rho' > 0, z' \in \{0, 1\} \\ \tilde{A}_{z,\text{f}}(\rho', z') & : \rho' \geq 1 \text{ or } z' \leq 1 \text{ or } z' > 2 \\ \tilde{A}_{z,\text{n}}(\rho', z') & : \text{else.} \end{cases} \quad (11)$$

For the case  $\rho' = 0$ , the following formulation is used:

$$\tilde{A}_{z,\text{ax}}(z') = \begin{cases} \tilde{A}_{z,\text{ax},\text{f}}(z') & : z' < -1 \text{ or } z' > 2 \\ \tilde{A}_{z,\text{ax},\text{n}}(z') & : \text{else} \end{cases} \quad (12)$$

with

$$\tilde{A}_{z,\text{ax},f}(z') = \text{atanh} \left( \frac{1}{|z'| + |1 - z'|} \right) \quad (13)$$

and

$$\tilde{A}_{z,\text{ax},n}(z') = \frac{1}{2} \frac{z'}{|z'|} \ln \left( \left| \frac{z'}{1 - z'} \right| \right). \quad (14)$$

The following formulation is used for the cases  $z' = 0$  or  $z' = 1$ :

$$\tilde{A}_{z,\text{rad}}(\rho') = \begin{cases} \tilde{A}_{z,\text{rad},f}(\rho') & : \rho' > 1 \\ \tilde{A}_{z,\text{rad},n}(\rho') & : \text{else} \end{cases} \quad (15)$$

with

$$\tilde{A}_{z,\text{rad},f}(\rho') = \text{atanh} \left( \frac{1}{\rho' + \sqrt{\rho'^2 + 1}} \right) \quad (16)$$

and

$$\tilde{A}_{z,\text{rad},n}(\rho') = \frac{1}{2} \ln \left( \frac{\rho'c + 1 + c}{\rho'c + 2s^2} \right), \quad (17)$$

where

$$c = \frac{1}{\sqrt{\rho'^2 + 1}} \quad (18)$$

$$s = \sin(\arctan(\rho')/2). \quad (19)$$

The case of  $\tilde{A}_{z,f}(\rho', z')$  is implemented as:

$$\tilde{A}_{z,f}(\rho', z') = \text{atanh}(\epsilon) \quad (20)$$

with  $r_i$ ,  $r_f$  and  $\epsilon$  from Eqn. (6), Eqn. (7) and Eqn. (8), respectively. The final case is implemented as follows:

$$\tilde{A}_{z,n}(\rho', z') = \frac{1}{2} [\ln(n + 2) - \ln(n)] \quad (21)$$

with

$$n = (r_i - z') + (r_f - (1 - z')) \quad (22)$$

$$r_i - z' = 2r_i \sin^2(\alpha/2) \quad (23)$$

$$r_f - (1 - z') = 2r_f \sin^2(\beta/2) \quad (24)$$

$$\alpha = \text{atan2}(\rho', z') \quad (25)$$

$$\beta = \text{atan2}(\rho', 1 - z') \quad (26)$$

and  $r_i$ ,  $r_f$  from Eqn. (6), Eqn. (7), respectively.

### 2.1.2. Magnetic Field

The magnetic field of a straight wire segment is given by [1]:

$$\mathbf{B} = \frac{\mu_0 I}{4\pi} \hat{\mathbf{e}}_z \times \mathbf{R}_i \frac{2L(R_i + R_f)}{R_i R_f} \frac{1}{(R_i + R_f)^2 - L^2}. \quad (27)$$

The vector  $\mathbf{R}_i$  has components in directions parallel ( $z$ ) and perpendicular ( $\rho$ ) to the wire segment:

$$\mathbf{R}_i = z \hat{\mathbf{e}}_z + \rho \hat{\mathbf{e}}_\rho \quad (28)$$

where  $\rho$  and  $z$  are cylindrical coordinates in the coordinate system aligned with the wire segment. The vector-valued term in Eqn. (27) is reformulated as follows by inserting Eqn. (28):

$$\begin{aligned} \hat{\mathbf{e}}_z \times \mathbf{R}_i &= \hat{\mathbf{e}}_z \times (z \hat{\mathbf{e}}_z + \rho \hat{\mathbf{e}}_\rho) \\ &= z \underbrace{\hat{\mathbf{e}}_z \times \hat{\mathbf{e}}_z}_{=0} + \rho \underbrace{\hat{\mathbf{e}}_z \times \hat{\mathbf{e}}_\rho}_{=\hat{\mathbf{e}}_\varphi} = \rho \hat{\mathbf{e}}_\varphi. \end{aligned} \quad (29)$$

It follows that the magnetic field of a straight wire segment only has a component  $B_\varphi$  in tangential ( $\varphi$ ) direction:

$$\mathbf{B} = B_\varphi \hat{\mathbf{e}}_\varphi \quad (30)$$

with

$$B_\varphi(\rho, z) = \frac{\mu_0 I}{4\pi} \frac{2\rho L(R_i + R_f)}{R_i R_f} \frac{1}{(R_i + R_f)^2 - L^2}. \quad (31)$$

This is now reformulated to use normalized coordinates (as done above for the computation of the magnetic vector potential):

$$B_\varphi(\rho', z') = \frac{\mu_0 I}{4\pi L} \left( \frac{1}{r_f} + \frac{1}{r_i} \right) \frac{2\rho'}{(r_i + r_f)^2 - 1}. \quad (32)$$

Again a normalization factor is split off:

$$B_\varphi(\rho', z') = \frac{\mu_0 I}{4\pi L} \tilde{B}_\varphi(\rho', z') \quad (33)$$

with

$$\tilde{B}_\varphi(\rho', z') = \left( \frac{1}{r_f} + \frac{1}{r_i} \right) \frac{2\rho'}{(r_i + r_f)^2 - 1}. \quad (34)$$

Consider the denominator in more detail:

$$\begin{aligned}
(r_{\text{i}} + r_{\text{f}})^2 - 1 &= r_{\text{i}}^2 + 2r_{\text{i}}r_{\text{f}} + r_{\text{f}}^2 - 1 \\
&= \rho'^2 + z'^2 + 2r_{\text{i}}r_{\text{f}} + \rho'^2 + (1 - z')^2 - 1 \\
&= \rho'^2 + z'^2 + 2r_{\text{i}}r_{\text{f}} + \rho'^2 - 1 - 2z' + z'^2 - 1 \\
&= 2\rho'^2 + 2z'^2 + 2r_{\text{i}}r_{\text{f}} - 2z' \\
&= 2 \left[ \rho'^2 + r_{\text{i}}r_{\text{f}} - z'(1 - z') \right] .
\end{aligned} \tag{35}$$

This leads to:

$$\tilde{B}_{\varphi}(\rho', z') = \left( \frac{1}{r_{\text{f}}} + \frac{1}{r_{\text{i}}} \right) \frac{\Im \rho'}{\Re [\rho'^2 + r_{\text{i}}r_{\text{f}} - z'(1 - z')]} . \tag{36}$$

One of several formulations is chosen depending on the evaluation location  $(\rho', z')$ :

$$\tilde{B}_{\varphi}(\rho', z') = \begin{cases} 0 & : \rho' = 0, \text{ any } z' \\ \tilde{B}_{\varphi, \text{rad}}(\rho') & : \rho' > 0, z' \in \{0, 1\} \\ \tilde{B}_{\varphi, \text{f}}(\rho', z') & : \rho' \geq 1 \text{ or } z' \leq 0 \text{ or } z' \geq 1 \\ & \text{or } \rho'/(1 - z') \geq 1 \\ & \text{or } \rho'/z' \geq 1 \\ \tilde{B}_{\varphi, \text{n}}(\rho', z') & : \text{else} . \end{cases} \tag{37}$$

The special case  $z' \in \{0, 1\}$  is implemented as follows:

$$\tilde{B}_{\varphi, \text{rad}}(\rho') = \frac{1}{\rho' \sqrt{\rho'^2 + 1}} . \tag{38}$$

The formula in Eqn. (36) is used for evaluation locations far away from the wire as well as a part of the near-field close to the wire segment:

$$\tilde{B}_{\varphi, \text{f}}(\rho', z') = \left( \frac{1}{r_{\text{f}}} + \frac{1}{r_{\text{i}}} \right) \frac{\rho'}{\rho'^2 + r_{\text{i}}r_{\text{f}} - z'(1 - z')} . \tag{39}$$

The final case is implemented as follows:

$$\tilde{B}_{\varphi, \text{n}}(\rho', z') = \left( \frac{1}{r_{\text{f}}} + \frac{1}{r_{\text{i}}} \right) \frac{\rho'}{\rho'^2 + 2r_{\text{i}} [r_{\text{f}} \sin^2(\beta/2) + (1 - z') \sin^2(\alpha/2)]} \tag{40}$$

with  $\alpha$  and  $\beta$  from Eqn. (25) and Eqn. (26), respectively.

## 2.2. Circular Wire Loop

The circular wire loop is handled next. The basic geometry of a circular wire loop under consideration here is shown in Fig. 2. Similar to the case of

Figure 2: Geometry of a circular wire loop centered at the origin with normal vector aligned with the  $z$ -axis. The radius of the loop is denoted  $a$  and a current  $I$  flows in the indicated direction. The magnetic field and vector potential are to be evaluated at the point  $\mathbf{x}$  in the  $(x, z)$ -plane. The coordinates of the evaluation point can be expressed in spherical coordinates as  $(r, \theta)$  or in cylindrical coordinates as  $(\rho, z)$ .

the straight wire segment, the magnetic vector potential and the magnetic field of the circular wire loop are assembled from various formulations for special cases of the far-field and the near-field.

### 2.2.1. Magnetic Vector Potential

The magnetic vector potential of a circular wire loop only has a tangential component  $A_\varphi$ . In Eqn. (5.37) of Ref. [2],  $A_\varphi$  is expressed as follows for a loop of radius  $a$  and current  $I$  along it:

$$A_\varphi(r, \theta) = \frac{\mu_0}{4\pi} \frac{4Ia}{\sqrt{a^2 + r^2 + 2ar \sin(\theta)}} \left[ \frac{(2 - k^2)\mathcal{K}(k) - 2\mathcal{E}(k)}{k^2} \right] \quad (41)$$

with

$$k^2 = \frac{4ar \sin(\theta)}{a^2 + r^2 + 2ar \sin(\theta)}. \quad (42)$$

Here,  $\mathcal{K}(k)$  and  $\mathcal{E}(k)$  are the complete elliptic integrals of the first and second kind, respectively. Spherical coordinates  $(r, \theta)$  are used to specify the evaluation location. The corresponding cylindrical coordinates  $(\rho, z)$  are given

by  $\rho = r \sin(\theta)$  and  $z = \sqrt{r^2 - \rho^2}$ . Normalized coordinates  $(\rho', z')$  are introduced with

$$\rho' = \rho/a \quad (43)$$

$$z' = z/a. \quad (44)$$

An expression for the linear combination of  $\mathcal{K}(k)$  and  $\mathcal{E}(k)$  is used to reformulate the expression provided by Jackson:

$$\lambda \mathcal{K}(k) + \mu \mathcal{E}(k) = \text{cel}(k_c, 1, \lambda + \mu, \lambda + \mu k_c^2) \quad (45)$$

where

$$k_c^2 = 1 - k^2 \quad (46)$$

and cel is the so-called general complete elliptic integral introduced by Bulirsch [3]:

$$\text{cel}(k_c, p, a, b) = \int_0^{\pi/2} \frac{a \cos^2(\varphi) + b \sin^2(\varphi)}{\cos^2(\varphi) + p \sin^2(\varphi)} \frac{d\varphi}{\sqrt{\cos^2(\varphi) + k_c^2 \sin^2(\varphi)}}. \quad (47)$$

The argument of the elliptic integrals is considered first:

$$\begin{aligned} k^2 &= \frac{4ar \sin(\theta)}{a^2 + r^2 + 2ar \sin(\theta)} = \frac{4a\rho}{a^2 + r^2 + 2a\rho} = \frac{4a\rho}{a^2 \left(1 + \frac{r^2}{a^2} + 2\frac{\rho}{a}\right)} \\ &= \frac{4\rho'}{1 + \frac{r^2}{a^2} + 2\rho'} = 4\rho' \left(1 + \frac{\rho'^2 + z'^2}{a^2} + 2\rho'\right)^{-1} \\ &= 4\rho' (1 + \rho'^2 + z'^2 + 2\rho')^{-1} = \frac{4\rho'}{z'^2 + (1 + \rho')^2}. \end{aligned} \quad (48)$$

This implies:

$$k_c^2 = \frac{z'^2 + (1 - \rho')^2}{z'^2 + (1 + \rho')^2}. \quad (49)$$

The coefficients of the elliptic integrals in Eqn. (41) are identified as follows:

$$\lambda = \frac{2 - k^2}{k^2} = \frac{2}{k^2} - 1 \quad (50)$$

$$\mu = -\frac{2}{k^2} \quad (51)$$

and their combinations are as follows for use in Eqn. (45):

$$\lambda + \mu = \frac{2}{k^2} - 1 - \frac{2}{k^2} = -1 \quad (52)$$

$$\begin{aligned} \lambda + \mu k_c^2 &= \frac{2}{k^2} - 1 - \frac{2}{k^2}(1 - k^2) \\ &= \frac{2}{k^2} - 1 - \frac{2}{k^2} + 2 = 1. \end{aligned} \quad (53)$$

Putting above results together, we arrive at the following expression for  $A_\varphi$ :

$$A_\varphi(\rho', z') = \frac{\mu_0 I}{\pi} \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \text{cel}(k_c, 1, -1, 1). \quad (54)$$

It is favorable for numerical evaluation of  $A_\varphi$  to use the form given in Eqn. (54) where the linear combination of the complete elliptic integrals is embedded in the parameters of cel and less precautions need to be taken to deal with cancellations in Eqn. (41). A physics-oriented prefactor is split off to be able to focus on geometry in the following:

$$A_\varphi(\rho', z') = \frac{\mu_0 I}{\pi} \tilde{A}_\varphi(\rho', z') \quad (55)$$

with

$$\tilde{A}_\varphi(\rho', z') = \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \text{cel}(k_c, 1, -1, 1). \quad (56)$$

One of several formulations for  $\tilde{A}_\varphi$  is chosen depending on the evaluation location  $(\rho', z')$ :

$$\tilde{A}_\varphi(\rho', z') = \begin{cases} 0 & : \rho' = 0, \text{ any } z' \\ \tilde{A}_{\varphi,\text{f}}(\rho', z') & : 0 < \rho' < 1/2 \text{ or } \rho' > 2 \text{ or } |z'| \geq 1 \\ \tilde{A}_{\varphi,\text{n}}(\rho', z') & : 1/2 \leq \rho' \leq 2 \text{ but } \rho' \neq 1, |z'| < 1 \\ \tilde{A}_{\varphi,\text{v}}(z') & : \text{else.} \end{cases} \quad (57)$$

The following formula is implemented for evaluation locations away from the wire loop:

$$\tilde{A}_{\varphi,\text{f}}(\rho', z') = \frac{k^2}{\sqrt{z'^2 + (1 + \rho')^2}} \mathcal{C}(k_c) \quad (58)$$

with  $k^2$  from Eqn. (48) and

$$\mathcal{C}(k_c) = \text{cel} \left( \frac{2\sqrt{k_c}}{1+k_c}, 1, 0, \frac{2}{(1+k_c)^3} \right). \quad (59)$$

Close to the wire loop, the following formulation is used:

$$\tilde{A}_{\varphi,n}(\rho', z') = \frac{1}{|\rho' - 1| \sqrt{\left(\frac{z'}{\rho'-1}\right)^2 + \left(1 + \frac{2}{\rho'-1}\right)^2}} \text{cel}(\sqrt{k_c^2}, 1, -1, 1) \quad (60)$$

with  $k_c^2$  computed as follows:

$$k_c^2 = \frac{\left(\frac{z'}{\rho'-1}\right)^2 + 1}{\left(\frac{z'}{\rho'-1}\right)^2 + \left(1 + \frac{2}{\rho'-1}\right)^2}. \quad (61)$$

At  $\rho' = 1$ , some further simplification can be carried out. This leads to the following formulation for  $\rho' = 1$  and  $|z'| < 1$ :

$$\tilde{A}_{\varphi,v}(z') = \frac{1}{|z'|} \text{cel} \left( \frac{1}{k_c}, 1, 1, -1 \right) \quad (62)$$

with  $k_c$  computed as follows:

$$k_c = \frac{|z'|}{\sqrt{4 + z'^2}}. \quad (63)$$

### 2.2.2. Magnetic Field

The magnetic field produced by a circular wire loop is made up of two components:

$$\mathbf{B} = B_\rho \hat{\mathbf{e}}_\rho + B_z \hat{\mathbf{e}}_z \quad (64)$$

where  $B_\rho$  denotes the radial component and  $B_z$  denotes the vertical component. The radial component  $B_\rho$  is given by [4]:

$$B_\rho(\rho', z') = \frac{\mu_0 I}{\pi a} \frac{z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \text{cel}(k_c, k_c^2, -1, 1) \quad (65)$$

Also here, a normalization factor is split off:

$$B_\rho(\rho', z') = \frac{\mu_0 I}{\pi a} \tilde{B}_\rho(\rho', z') \quad (66)$$

with

$$\tilde{B}_\rho(\rho', z') = \frac{z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \text{cel}(k_c, k_c^2, -1, 1). \quad (67)$$

One of several formulations is chosen depending on the evaluation location  $(\rho', z')$ :

$$\tilde{B}_\rho(\rho', z') = \begin{cases} 0 & : \rho' = 0, \text{ any } z' \\ & \text{or } \rho' > 0, z' = 0 \\ \tilde{B}_{\rho,f}(\rho', z') & : \rho' < 1/2 \text{ or } \rho' > 2 \text{ or } |z'| \geq 1 \\ \tilde{B}_{\rho,n}(\rho', z') & : 1/2 \leq \rho' \leq 2 \text{ but } \rho' \neq 1, |z'| < 1 \\ \tilde{B}_{\rho,v}(z') & : \text{else.} \end{cases} \quad (68)$$

The following formulation is implemented for evaluation locations away from to the wire loop:

$$\tilde{B}_{\rho,f}(\rho', z') = \frac{4\rho' z' [\mathcal{D}(k_c) - \mathcal{C}(k_c)]}{[z'^2 + (1 + \rho')^2]^{3/2} [z'^2 + (1 - \rho')^2]} \quad (69)$$

with

$$\mathcal{D}(k_c) = \frac{\mathcal{K}(k) - \mathcal{E}(k)}{k^2} = \text{cel}(k_c, 1, 0, 1). \quad (70)$$

For points close to the wire loop, but with  $\rho' \neq 1$ , the following formulation is used:

$$\tilde{B}_{\rho,n}(\rho', z') = \frac{4\rho' \left| \frac{z'}{\rho' - 1} \right| [\mathcal{D}(k_c) - \mathcal{C}(k_c)]}{(\rho' - 1)^4} \left\{ \left[ \left( \frac{z'}{\rho' - 1} \right)^2 + \left( 1 + \frac{2}{\rho' - 1} \right)^2 \right]^{3/2} \left[ \left( \frac{z'}{\rho' - 1} \right)^2 + 1 \right] \right\}^{-1}. \quad (71)$$

Finally, for  $\rho' = 1$  and  $|z'| < 1$ , the following formulation is used:

$$\tilde{B}_{\rho,v}(z') = \frac{1}{2} k_c \left[ \left( \frac{2}{z'^2} + 1 \right) \mathcal{E}(k_c) - \mathcal{K}(k_c) \right] \quad (72)$$

with

$$k_c^2 = \frac{1}{1 + 4/z'^2} \quad (73)$$

and

$$\mathcal{K}(k_c) = \text{cel}(k_c, 1, 1, 1) \quad (74)$$

$$\mathcal{E}(k_c) = \text{cel}(k_c, 1, 1, k_c^2) . \quad (75)$$

The vertical component  $B_z$  of the magnetic field of a circular wire loop is given by [4]:

$$B_z(\rho', z') = \frac{\mu_0 I}{2\pi a} \frac{1}{\rho' \sqrt{z'^2 + (1 + \rho')^2}} \left[ \text{cel}(k_c, 1, -1, 1) + \frac{1 + k_c^2 - (1 - k_c^2) \rho'}{2} \text{cel}(k_c, k_c^2, -1, 1) \right] \quad (76)$$

A normalization factor is split off here as well:

$$B_z(\rho', z') = \frac{\mu_0 I}{\pi a} \tilde{B}_z(\rho', z') \quad (77)$$

with

$$\tilde{B}_z(\rho', z') = \frac{1}{2\rho' \sqrt{z'^2 + (1 + \rho')^2}} \left[ \text{cel}(k_c, 1, -1, 1) + \frac{1 + k_c^2 - (1 - k_c^2) \rho'}{2} \text{cel}(k_c, k_c^2, -1, 1) \right] . \quad (78)$$

The evaluation of this formula is split up as well into separate special cases. One of several formulations is selected depending on the evaluation location  $(\rho', z')$ :

$$\tilde{B}_z(\rho', z') = \begin{cases} \tilde{B}_{z,\text{fl}}(\rho', z') & : \rho' < 1/2 \text{ or } (\rho' \leq 2 \text{ and } z' > 1) \\ \tilde{B}_{z,\text{f2}}(\rho', z') & : \rho' > 2 \\ \tilde{B}_{z,\text{v}}(z') & : \rho' = 1 \\ \tilde{B}_{z,\text{n}}(\rho', z') & : \text{else} \end{cases} . \quad (79)$$

For points not too close to the wire loop, the following formulation is used:

$$\tilde{B}_{z,\text{fl}}(\rho', z') = \frac{1}{\sqrt{z'^2 + (1 + \rho')^2} [z'^2 + (1 - \rho')^2]} \{ \mathcal{E}(k_c) + \rho' [\mathcal{E}(k_c) - 2\mathcal{K}(k_c) + 2\mathcal{D}(k_c)] \} . \quad (80)$$

A second far-field method is needed for points with  $\rho' > 2$ :

$$\tilde{B}_{z,\text{f2}}(\rho', z') = \frac{1}{\sqrt{t_1 + t_2}(t_1 - t_2)\rho'^3} \left\{ \mathcal{E}(k_c) + \frac{4}{\alpha_{\text{cd}}} [\mathcal{C}(k_c) - \mathcal{D}(k_c)] \right\} \quad (81)$$

with

$$t_1 = \frac{z'^2 + 1}{\rho'^2} + 1 \quad (82)$$

$$t_2 = \frac{2}{\rho'} \quad (83)$$

and

$$\alpha_{\text{cd}} = 1 + \frac{1}{\rho'} \left[ 2 + \frac{1}{\rho'} (1 + z'^2) \right]. \quad (84)$$

The expression for  $\tilde{B}_z$  becomes significantly simpler at  $\rho' = 1$ , which is considered next:

$$\tilde{B}_{z,\text{v}}(z') = \frac{1}{[z'^2 + 4]^{3/2}} \text{cel} \left( \sqrt{k_c^2}, k_c^2, 2, 0 \right) \quad (85)$$

with

$$k_c^2 = \frac{z'^2}{z'^2 + 4}. \quad (86)$$

In the vicinity of the wire loop, but with  $z' \neq 0$ , the following method is used to compute  $\tilde{B}_z$ :

$$\tilde{B}_{z,\text{n}}(\rho', z') = \frac{\text{cel} \left( \sqrt{k_c^2}, k_c^2, 1 + \rho', 1 - \rho' \right)}{|\rho' - 1|^3 \left[ \left( \frac{z'}{\rho' - 1} \right)^2 + \left( 1 + \frac{2}{\rho' - 1} \right)^2 \right]^{3/2}}. \quad (87)$$

### 2.3. Evaluation in Global Coordinates

Evaluation of the magnetic vector potential  $\mathbf{A}$  and magnetic field  $\mathbf{B}$  produced by the current carriers considered in this work happens in cylindrical coordinates  $\rho$  and  $z$  in the coordinate system of the current carriers. It is often more convenient to be able to work in global coordinates. The methods given in this section show how to transform the evaluation location into cylindrical coordinates in the frame of reference of the current carrier and subsequently transform back the magnetostatic quantities into the global coordinate system.

Figure 3: Mapping the components to global coordinates for an exemplary straight wire segment. The wire segment is positioned from  $\mathbf{x}_i$  to  $\mathbf{x}_f$ . Its parallel unit vector is denoted  $\hat{\mathbf{e}}_z$ . The length of the wire segment is denoted by  $L$ . The evaluation location is denoted by  $\mathbf{r}$ .

### 2.3.1. Straight Wire Segment

Figure 3 illustrates the setup for a straight wire segment. The length of the wire segment is denoted by  $L$ :

$$L = |\mathbf{x}_f - \mathbf{x}_i|. \quad (88)$$

If  $L = 0$ , no contribution is taken into account from the wire segment. Otherwise, the unit vector along the segment  $\hat{\mathbf{e}}_z$  is computed as:

$$\hat{\mathbf{e}}_z = \frac{\mathbf{x}_f - \mathbf{x}_i}{L}. \quad (89)$$

The vertical coordinate  $z$  in the coordinate system of the wire segment is:

$$z = (\mathbf{r} - \mathbf{x}_i) \cdot \hat{\mathbf{e}}_z \quad (90)$$

and the normalized  $z$ -coordinate is:

$$z' = \frac{z}{L} = \frac{1}{L}(\mathbf{r} - \mathbf{x}_i) \cdot \hat{\mathbf{e}}_z. \quad (91)$$

For the radial coordinate, first the vector  $\Delta \mathbf{r}$  is formed:

$$\Delta \mathbf{r} = (\mathbf{r} - \mathbf{x}_i) - z \hat{\mathbf{e}}_z \quad (92)$$

and the radial coordinate  $\rho$  is then obtained by taking  $\rho = |\Delta \mathbf{r}|$ . The normalized radial coordinate  $\rho'$  is then obtained as:

$$\rho' = \frac{\rho}{a} = \frac{1}{a} |(\mathbf{r} - \mathbf{x}_i) - z \hat{\mathbf{e}}_z|. \quad (93)$$

The magnetic vector potential only has a component in parallel direction in the coordinate system of the wire segment. The vector potential of the circular wire loop is thus in Cartesian coordinates:

$$\mathbf{A}(\mathbf{r}) = A_z(\rho', z') \hat{\mathbf{e}}_z. \quad (94)$$

If  $\rho' \neq 0$ , a unit vector in radial direction is formed as follows:

$$\hat{\mathbf{e}}_\rho = \frac{\Delta \mathbf{r}}{\rho} \quad (95)$$

and the magnetic field of the straight wire segment (consisting only of the tangential component  $B_\varphi$ ) is evaluated as:

$$\mathbf{B}(\mathbf{r}) = B_\varphi(\rho', z') \hat{\mathbf{e}}_\varphi \quad (96)$$

with  $\hat{\mathbf{e}}_\varphi = \hat{\mathbf{e}}_z \times \hat{\mathbf{e}}_\rho$ .

### 2.3.2. Circular Wire Loop

Figure 4 illustrates the setup of a circular wire loop. The  $z$ -axis of the coordinate system of the wire loop is defined by the normal vector  $\mathbf{n}$ :

$$\hat{\mathbf{e}}_z = \frac{\mathbf{n}}{|\mathbf{n}|}. \quad (97)$$

The  $z$  component of the evaluation location is thus obtained as follows:

$$z = (\mathbf{r} - \mathbf{r}_0) \cdot \hat{\mathbf{e}}_z. \quad (98)$$

The normalized  $z$ -coordinate  $z'$  is then obtained as:

$$z' = \frac{z}{a} = \frac{1}{a} (\mathbf{r} - \mathbf{r}_0) \cdot \hat{\mathbf{e}}_z. \quad (99)$$

For the radial coordinate, first the vector  $\Delta \mathbf{r}$  is formed:

$$\Delta \mathbf{r} = (\mathbf{r} - \mathbf{r}_0) - z \hat{\mathbf{e}}_z \quad (100)$$

Figure 4: Mapping the components to Cartesian coordinates for an exemplary circular wire loop. The loop is centered around its origin  $\mathbf{r}_0$ . Its normal vector is denoted  $\mathbf{n}$  and defines the orientation of the loop. The radius of the loop is denoted by  $a$ . The evaluation location is denoted by  $\mathbf{r}$ .

and the radial coordinate  $\rho$  is then obtained by taking  $\rho = |\Delta \mathbf{r}|$ . The normalized radial coordinate  $\rho'$  is then obtained as:

$$\rho' = \frac{\rho}{a} = \frac{1}{a} |(\mathbf{r} - \mathbf{r}_0) - z \hat{\mathbf{e}}_z|. \quad (101)$$

The magnetic field of the circular wire loop consists of two cylindrical components, namely  $B_\rho$  and  $B_z$ . The Cartesian magnetic field components are then computed as follows:

$$\mathbf{B}(\mathbf{r}) = B_\rho(\rho', z') \hat{\mathbf{e}}_\rho + B_z(\rho', z') \hat{\mathbf{e}}_z. \quad (102)$$

If  $\rho' = 0$ , only  $B_z$  is evaluated. Otherwise, a unit vector in radial direction is formed as follows:

$$\hat{\mathbf{e}}_\rho = \frac{\Delta \mathbf{r}}{\rho} \quad (103)$$

and  $B_\rho$  is evaluated as well. The magnetic vector potential only has a component in tangential direction in the coordinate system of the wire loop. It is also only evaluated if  $\rho' \neq 0$ . The corresponding unit vector  $\hat{\mathbf{e}}_\varphi$  is then given by  $\hat{\mathbf{e}}_\varphi = \hat{\mathbf{e}}_z \times \hat{\mathbf{e}}_\rho$ . The vector potential of the circular wire loop is thus in Cartesian coordinates:

$$\mathbf{A}(\mathbf{r}) = A_\varphi(\rho', z') \hat{\mathbf{e}}_\varphi. \quad (104)$$

#### 2.4. Verification Method

The asymptotic behavior of an implementation of above formulas for the magnetic vector potential and magnetic field needs to be tested before using that implementation in routine work.

A set of critical test points used to check this is shown in Fig. 5 for the case of the circular wire loop.

Figure 5: Test points in the  $R$ - $Z$ -plane for a circular wire loop (black dot). The axes are labeled in normalized cylindrical coordinates ( $\rho' = \rho/a$ ,  $z' = z/a$ ;  $a$  is the radius of the wire loop). Green dashed lines indicate values of  $\rho'$  and  $z'$  which are well handled by a naive implementation. Green dots denote points at which a naive implementation yields satisfactory results. Red dashed lines indicate values of  $\rho'$  and  $z'$  which induce the requirement for robust asymptotic behavior. Red dots denote points at which a naive implementation usually fails. The grey shaded area in the background indicates the region in which the reference implementation yields accurate results. Note that the problem is symmetric in  $z$  direction, even though only the positive- $z$  quadrant is considered here.

The reference results are computed on each test point using arbitrary-precision arithmetic as provided by the Python package `mpmath` [5] and Mathematica [6]. The test point coordinates are computed within the finite-precision test programs used to check the accuracy of the results. This implies that the exact *implied* values of the test point coordinates have to be transported into the arbitrary-precision software used to compute the reference data. The evaluation positions are specified at IEEE754 `float64` floating-point numbers. The floating point numbers are re-constructed within the arbitrary-precision software in order to properly transport their intended

value. In case of `float64`, this is done as follows for a floating-point number  $f$ :

$$f(s, E, M) = \begin{cases} 0 & : E = 0 \text{ and } M = 0 \\ (-1)^s 2^{E-1023} \left(1 + \frac{M}{2^{52}}\right) & : \text{else} \end{cases} \quad (105)$$

where  $s$  is the sign bit,  $E$  is the exponent specified as an 11-bit unsigned integer and  $M$  is the mantissa specified as a 52-bit unsigned integer. Several special cases are defined for certain values of  $s$ ,  $E$  and  $M$ , but in the context of this work only the case  $E = 0$ ,  $M = 0$  ( $s$  arbitrary), which represents an exact zero, is relevant. The organization of those bits in a `float64` number is shown in Fig. 6. In particular, a test point coordinate value  $f$  is passed to

Figure 6: Organization of sign bit  $s$ , exponent  $E$  (11 bits, unsigned integer) and mantissa  $M$  (52 bits, unsigned integer) within the 64 bits of a IEEE754 `float64` floating-point number. Each box represents one bit and the colors indicate which quantity a bit belongs to (red: sign bit, green: exponent, blue: mantissa).

the reference computation by passing the three values  $s$ ,  $E$  and  $M$  as integers (which are easy to represent exactly). Within the reference computation, the value of  $f$  is constructed using Eqn. (105) implemented in arbitrary precision and with the exact values of  $s$ ,  $E$  and  $M$ .

The reference data for the straight wire segment methods is computed using 300 decimal digits of precision. The reference data for the circular wire loop is computed using 200 decimal digits of precision.

The evaluation position is specified exactly via  $s_\rho$ ,  $E_\rho$  and  $M_\rho$  (for  $\rho'$ ) and  $s_z$ ,  $E_z$  and  $M_z$  (for  $z'$ ):

$$\begin{aligned} \rho' &\leftarrow (-1)^{s_\rho} 2^{E_\rho-1023} \left(1 + \frac{M_\rho}{2^{52}}\right) \\ z' &\leftarrow (-1)^{s_z} 2^{E_z-1023} \left(1 + \frac{M_z}{2^{52}}\right) \end{aligned} \quad (106)$$

The following algorithm is used to compute reference values of  $\tilde{A}_z$  and  $\tilde{B}_\varphi$  at  $(\rho', z')$  for the straight wire segment:

$$\begin{aligned}
r_i &\leftarrow \sqrt{\rho'^2 + z'^2} \\
r_f &\leftarrow \sqrt{\rho'^2 + (1 - z')^2} \\
\epsilon &\leftarrow (r_i + r_f)^{-1} \\
\tilde{A}_z &\leftarrow \operatorname{atanh}(\epsilon) \\
\tilde{B}_\varphi &\leftarrow \left( \frac{1}{r_i} + \frac{1}{r_f} \right) \frac{\rho'}{r_i r_f + \rho'^2 + z'(z' - 1)}
\end{aligned} \tag{107}$$

The following algorithm is used to compute reference values of  $\tilde{A}_\varphi$  and  $\tilde{B}_\rho$  at  $(\rho', z')$  for the circular wire loop:

$$\begin{aligned}
k_c^2 &\leftarrow \frac{z'^2 + (1 - \rho')^2}{z'^2 + (1 + \rho')^2} \\
\tilde{A}_\varphi &\leftarrow \begin{cases} 0 & : \rho' = 0 \\ \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \int_0^{\pi/2} \frac{\sin^2(\varphi) - \cos^2(\varphi)}{\sqrt{\cos^2(\varphi) + k_c^2 \sin^2(\varphi)}} d\varphi & : \text{else} \end{cases}
\end{aligned} \tag{108}$$

$$\tilde{B}_\rho \leftarrow \begin{cases} 0 & : \rho' = 0 \text{ or } z' = 0 \\ \frac{z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \int_0^{\pi/2} \frac{\sin^2(\varphi) - \cos^2(\varphi)}{[\cos^2(\varphi) + k_c^2 \sin^2(\varphi)]^{3/2}} d\varphi & : \text{else} \end{cases} \tag{109}$$

The method used to compute  $\tilde{B}_z$  works slightly differently:

$$\begin{aligned}
k^2 &\leftarrow \begin{cases} 4 / \left( \frac{1}{\rho'} + 2 + \rho' \right) & : z' = 0 \\ \frac{4\rho'}{z'^2 + (1 + \rho')^2} & : \text{else} \end{cases} \\
\tilde{B}_z &\leftarrow \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \int_0^{\pi/2} \frac{(1 - \rho') \sin^2(\varphi) + (1 + \rho') \cos^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi
\end{aligned} \tag{110}$$

The integrals are carried out numerically within the arbitrary-precision software. In case of `mpmath`, double-exponential quadrature [7] is used [8].

The error metric employed in this work is given as follows:

$$\delta(a, b) = \begin{cases} \log_{10} \left( \min \left( 1, \left| \frac{a-b}{b} \right| \right) \right) & : b \neq 0, a \neq b \\ 0 & : b = 0, a \neq 0 \\ -16 & : \text{else} \end{cases} \quad (111)$$

where the constant  $-16$  is chosen for `float64` as  $\lfloor \log_{10}(\epsilon_{64}) \rfloor$  with the machine-precision epsilon  $\epsilon_{64} \approx 2.2 \times 10^{-16}$ .

### 3. Results

Figure 7:  $\tilde{A}_z$  of straight wire segment: Comparison of the Java implementation against the reference data.

#### 3.1. Further tests

A second-order correction to the polygon approximation for a circular wire loop [9] was tested. Second-order iterative Kahan-Babuska summation [10] had to be used to achieve convergence down to numerical accuracy.

$B_\varphi$  of Straight Wire Segment (Java)

Figure 9:  $\tilde{A}_\phi$  of circular wire loop: Comparison of the Java implementation against the reference data.

Figure 10:  $\tilde{B}_\rho$  of circular wire loop: Comparison of the Java implementation against the reference data.

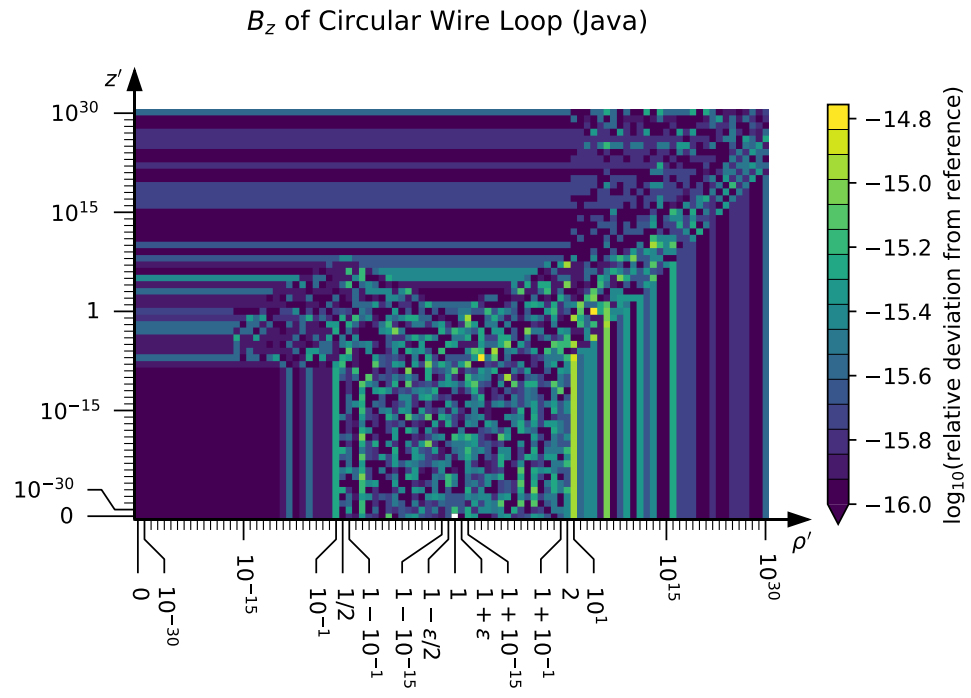

Figure 11:  $\tilde{B}_z$  of circular wire loop: Comparison of the Java implementation against the reference data.

#### **4. Discussion**

It turns out that most of these problems have been considered in Ref. [11] already.

## 5. Outlook

## Appendix A. Derivations

The derivations of the formulas presented in Sec. 2 are given here.

### Appendix A.1. Straight Wire Segment

The following geometric quantities with  $\mathbf{x}_f \equiv \mathbf{x}_{i+1}$  are defined to ease the rest of the derivation:

$$L \equiv |\mathbf{x}_f - \mathbf{x}_i|, \quad (\text{A.1})$$

$$\hat{\mathbf{e}} \equiv (\mathbf{x}_f - \mathbf{x}_i) / L, \quad (\text{A.2})$$

$$\mathbf{R}_i \equiv \mathbf{x} - \mathbf{x}_i, \quad (\text{A.3})$$

$$\mathbf{R}_f \equiv \mathbf{x} - \mathbf{x}_f, \quad (\text{A.4})$$

$$R_i \equiv |\mathbf{R}_i| = |\mathbf{x} - \mathbf{x}_i|, \quad (\text{A.5})$$

$$R_f \equiv |\mathbf{R}_f| = |\mathbf{x} - \mathbf{x}_f|, \quad (\text{A.6})$$

$$R_{i||} \equiv \hat{\mathbf{e}} \cdot \mathbf{R}_i, \quad (\text{A.7})$$

$$R_{f||} \equiv \hat{\mathbf{e}} \cdot \mathbf{R}_f, \quad (\text{A.8})$$

$$\mathbf{R}_\perp \equiv \mathbf{R}_i - R_{i||}\hat{\mathbf{e}}, \quad (\text{A.9})$$

$$R_\perp \equiv |\mathbf{R}_\perp| \quad \text{and} \quad (\text{A.10})$$

$$\mathbf{c}(\lambda) \equiv \mathbf{x}_i + \lambda(\mathbf{x}_f - \mathbf{x}_i) \quad \text{for} \quad 0 \leq \lambda \leq 1. \quad (\text{A.11})$$

The following relations are also needed:

$$L = R_{i||} - R_{f||} \quad (\text{A.12})$$

$$R_i^2 - R_f^2 = L(R_{i||} + R_{f||}) \quad (\text{A.13})$$

$$\Rightarrow R_{i||} = \frac{R_i^2 - R_f^2}{2L} + \frac{L}{2} \quad (\text{A.14})$$

$$\Rightarrow R_{f||} = \frac{R_i^2 - R_f^2}{2L} - \frac{L}{2} \quad (\text{A.15})$$

#### Appendix A.1.1. Magnetic Vector Potential

The law of Biot and Savart for the magnetic vector potential of a current density distribution  $\mathbf{j}(\mathbf{x})$  is as follows [2]:

$$\mathbf{A}(\mathbf{x}) = \frac{\mu_0}{4\pi} \int \frac{\mathbf{j}(\mathbf{x}')}{|\mathbf{x} - \mathbf{x}'|} d\mathbf{x}'. \quad (\text{A.16})$$

The parametrization of points on the line segment  $\mathbf{c}(\lambda)$  can be used to apply this to the given geometry of a wire segment:

$$\mathbf{A}(\mathbf{x}) = \frac{\mu_0 I}{4\pi} L \hat{\mathbf{e}} \int_0^1 \frac{d\lambda}{|\mathbf{x} - \mathbf{c}(\lambda)|} \quad (\text{A.17})$$

$$= \frac{\mu_0 I}{4\pi} L \hat{\mathbf{e}} \int_0^1 \frac{d\lambda}{|\mathbf{x} - \mathbf{x}_i - \lambda L \hat{\mathbf{e}}|} . \quad (\text{A.18})$$

A little bit of geometric intuition is needed to simplify the denominator of the integral:

$$\mathbf{x} - \mathbf{x}_i - \lambda L \hat{\mathbf{e}} = \mathbf{R}_i - \lambda L \hat{\mathbf{e}} \quad (\text{A.19})$$

$$= \mathbf{R}_i - R_{i||} \hat{\mathbf{e}} + R_{i||} \hat{\mathbf{e}} - \lambda L \hat{\mathbf{e}} \quad (\text{A.20})$$

$$= \mathbf{R}_i - R_{i||} \hat{\mathbf{e}} + (R_{i||} - \lambda L) \hat{\mathbf{e}} \quad (\text{A.21})$$

$$= \mathbf{R}_\perp + (R_{i||} - \lambda L) \hat{\mathbf{e}} . \quad (\text{A.22})$$

Note that, in particular,  $\mathbf{R}_\perp \perp \hat{\mathbf{e}}$  and thus (since  $|\hat{\mathbf{e}}| = 1$ ) due to Pythagoras:

$$|\mathbf{x} - \mathbf{x}_i - \lambda L \hat{\mathbf{e}}|^2 = R_\perp^2 + (R_{i||} - \lambda L)^2 \quad (\text{A.23})$$

and finally with  $R_\perp^2 = R_i^2 - R_{i||}^2$  (also due to Pythagoras):

$$|\mathbf{x} - \mathbf{x}_i - \lambda L \hat{\mathbf{e}}|^2 = R_i^2 - R_{i||}^2 + R_{i||}^2 - 2\lambda L R_{i||} + \lambda^2 L^2 \quad (\text{A.24})$$

$$= R_i^2 - 2\lambda L R_{i||} + \lambda^2 L^2 . \quad (\text{A.25})$$

It follows:

$$\mathbf{A}(\mathbf{x}) = \frac{\mu_0 I}{4\pi} L \hat{\mathbf{e}} \int_0^1 \frac{d\lambda}{\sqrt{R_i^2 - 2\lambda L R_{i||} + \lambda^2 L^2}} . \quad (\text{A.26})$$

The following relation holds for  $R = a + bx + cx^2$ ,  $\Delta = 4ac - b^2$  with  $c > 0$ ,  $2cx + b > \sqrt{-\Delta}$  and  $\Delta < 0$  according to integral (2.261) in Ref. [12]:

$$\int \frac{dx}{\sqrt{R}} = \frac{1}{\sqrt{c}} \log \left( 2\sqrt{cR} + 2cx + b \right) . \quad (\text{A.27})$$

**TODO: check applicability !!!**

Here,  $x = \lambda$ ,  $a = R_i^2$ ,  $b = -2LR_{i||}$  and  $c = L^2$ . The corresponding antiderivative of the integrand in Eqn. (A.26) is:

$$\begin{aligned} & \int \frac{d\lambda}{\sqrt{R_i^2 - 2\lambda LR_{i||} + \lambda^2 L^2}} \\ &= \frac{1}{L} \log \left( 2\sqrt{L^2 (L^2 \lambda^2 - 2LR_{i||}\lambda + R_i^2)} + 2L^2 \lambda - 2LR_{i||} \right). \end{aligned} \quad (\text{A.28})$$

The definite integral in Eqn. (A.26) is therefore solved by the following expression:

$$\int_0^1 \frac{d\lambda}{\sqrt{R_i^2 - 2\lambda LR_{i||} + \lambda^2 L^2}} \quad (\text{A.29})$$

$$\begin{aligned} &= \frac{1}{L} \left[ \log \left( 2\sqrt{L^2 (L^2 - 2LR_{i||} + R_i^2)} + 2L^2 - 2LR_{i||} \right) \right. \\ &\quad \left. - \log \left( 2\sqrt{L^2 R_i^2 - 2LR_{i||}} \right) \right] \end{aligned} \quad (\text{A.30})$$

$$= \frac{1}{L} \log \left( \frac{2L\sqrt{L^2 - 2LR_{i||} + R_i^2} + 2L^2 - 2LR_{i||}}{2LR_i - 2LR_{i||}} \right) \quad (\text{A.31})$$

Note that

$$L^2 = L(R_{i||} - R_{f||}) \quad (\text{A.32})$$

$$= LR_{i||} - LR_{f||} \quad (\text{A.33})$$

$$\Rightarrow -2LR_{i||} + L^2 = -2LR_{i||} + LR_{i||} - LR_{f||} \quad (\text{A.34})$$

$$= -L(R_{i||} + R_{f||}) \quad (\text{A.35})$$

$$= R_f^2 - R_i^2 \quad (\text{A.36})$$

$$\Rightarrow R_f^2 = R_i^2 - 2LR_{i||} + L^2. \quad (\text{A.37})$$

Therefore:

$$\int_0^1 \frac{d\lambda}{\sqrt{R_i^2 - 2\lambda LR_{i||} + \lambda^2 L^2}} = \frac{1}{L} \log \left( \frac{R_f - R_{f||}}{R_i - R_{i||}} \right). \quad (\text{A.38})$$

Inserting this into Eqn. (A.26) leads to the first intermediate result:

$$\mathbf{A}(\mathbf{x}) = \frac{\mu_0 I}{4\pi} \frac{1}{L} \log \left( \frac{R_f - R_{f||}}{R_i - R_{i||}} \right) \hat{\mathbf{e}} = \frac{\mu_0 I}{4\pi} \log \left( \frac{R_f - R_{f||}}{R_i - R_{i||}} \right) \hat{\mathbf{e}}. \quad (\text{A.39})$$

However, if the point  $\mathbf{x}$  is located on the line extension of the wire segment,  $R_i = R_{i||}$  and  $R_f = R_{f||}$ , which leads to a 0/0 division if this formula is directly evaluated. The solution is to cancel the singular term  $(L + R_f - R_i)$ , which is also zero for points on the line extension of the wire segment, in the numerator and the denominator of Eqn. (A.39). A second look resolves this:

$$\frac{R_f - R_{f||}}{R_i - R_{i||}} = \frac{2L(R_f - R_{f||})}{2L(R_i - R_{i||})} = \frac{2LR_f - 2L\left(\frac{R_i^2 - R_f^2}{2L} - \frac{L}{2}\right)}{2LR_i - 2L\left(\frac{R_i^2 - R_f^2}{2L} + \frac{L}{2}\right)} \quad (\text{A.40})$$

$$= \frac{2LR_f - R_i^2 + R_f^2 + L^2}{2LR_i - R_i^2 + R_f^2 - L^2} \quad (\text{A.41})$$

$$= \frac{2LR_f - R_i^2 + R_f^2 + L^2 + LR_i - LR_i + R_i R_f - R_i R_f}{2LR_i - R_i^2 + R_f^2 - L^2 + LR_f - LR_f + R_i R_f - R_i R_f} \quad (\text{A.42})$$

$$= \frac{\cancel{(L + R_f - R_i)}(R_f + R_i + L)}{\cancel{(L + R_f - R_i)}(R_f + R_i - L)} = \frac{R_f + R_i + L}{R_f + R_i - L}. \quad (\text{A.43})$$

It follows for the vector potential expression:

$$\mathbf{A}(\mathbf{x}) = \frac{\mu_0 I}{4\pi} \log \left( \frac{R_f + R_i + L}{R_f + R_i - L} \right) \hat{\mathbf{e}}. \quad (\text{A.44})$$

The authors of Ref. [1] suggest to normalize the length of the wire segment:

$$\frac{R_f + R_i + L}{R_f + R_i - L} = \frac{1 + \epsilon}{1 - \epsilon} \quad \text{with } \epsilon \equiv \frac{L}{R_i + R_f}, \quad (\text{A.45})$$

leading to

$$\mathbf{A}(\mathbf{x}) = \frac{\mu_0 I}{4\pi} \log \left( \frac{1 + \epsilon}{1 - \epsilon} \right) \hat{\mathbf{e}}. \quad (\text{A.46})$$

This is the result for the magnetic vector potential of a filamentary wire segment presented in Ref. [1]. Note that

$$\text{artanh}(\epsilon) = \frac{1}{2} \log \left( \frac{1 + \epsilon}{1 - \epsilon} \right), \quad (\text{A.47})$$

leading to

$$\mathbf{A}(\mathbf{x}) = \frac{\mu_0 I}{2\pi} \text{artanh}(\epsilon) \hat{\mathbf{e}}. \quad (\text{A.48})$$

*Appendix A.1.2. Magnetic Field*

The law of Biot and Savart for the magnetic field of a current density distribution  $\mathbf{j}(\mathbf{x})$  is as follows [2]:

$$\mathbf{B}(\mathbf{x}) = \frac{\mu_0}{4\pi} \int \mathbf{j}(\mathbf{x}') \times \frac{\mathbf{x} - \mathbf{x}'}{|\mathbf{x} - \mathbf{x}'|^3} d\mathbf{x}'. \quad (\text{A.49})$$

The magnetic field  $\mathbf{B}(\mathbf{x})$  is computed from  $\mathbf{B} = \nabla \times \mathbf{A}$ , applied to Eqn. (A.46). Define

$$f(\epsilon) \equiv \log \left( \frac{1 + \epsilon}{1 - \epsilon} \right) \quad (\text{A.50})$$

and it follows:

$$\frac{4\pi}{\mu_0 I} \mathbf{B} = \nabla \times (f(\epsilon) \hat{\mathbf{e}}) = \nabla f(\epsilon) \times \hat{\mathbf{e}} + f(\epsilon) \underbrace{\nabla \times \hat{\mathbf{e}}}_{=0} = f'(\epsilon) \nabla \epsilon \times \hat{\mathbf{e}}. \quad (\text{A.51})$$

Note that

$$\begin{aligned} \nabla \epsilon &= \nabla \left( \frac{L}{R_i + R_f} \right) = \frac{-L}{(R_i + R_f)^2} (\nabla R_i + \nabla R_f) \\ &= \frac{-L}{(R_i + R_f)^2} \left( \frac{\mathbf{R}_i}{R_i} + \frac{\mathbf{R}_f}{R_f} \right). \end{aligned} \quad (\text{A.52})$$

It follows:

$$\frac{4\pi}{\mu_0 I} \mathbf{B} = f'(\epsilon) \frac{-L}{(R_i + R_f)^2} \left( \frac{\mathbf{R}_i}{R_i} + \frac{\mathbf{R}_f}{R_f} \right) \times \hat{\mathbf{e}} \quad (\text{A.53})$$

$$= f'(\epsilon) \frac{L}{(R_i + R_f)^2} \hat{\mathbf{e}} \times \left( \frac{\mathbf{R}_i}{R_i} + \frac{\mathbf{R}_f}{R_f} \right) \quad (\text{A.54})$$

$$= f'(\epsilon) \frac{\epsilon^2}{L} \hat{\mathbf{e}} \times \left( \frac{\mathbf{R}_i}{R_i} + \frac{\mathbf{R}_f}{R_f} \right). \quad (\text{A.55})$$

Also:

$$\begin{aligned} \frac{\mathbf{R}_i}{R_i} + \frac{\mathbf{R}_f}{R_f} &= \frac{\mathbf{R}_i}{R_i} + \frac{\mathbf{R}_i - L\hat{\mathbf{e}}}{R_f} = \frac{R_f \mathbf{R}_i + R_i(\mathbf{R}_i - L\hat{\mathbf{e}})}{R_i R_f} \\ &= \frac{(R_f + R_i)\mathbf{R}_i + R_i L\hat{\mathbf{e}}}{R_i R_f} = \frac{R_f + R_i}{R_i R_f} \mathbf{R}_i + \frac{R_i L}{R_i R_f} \hat{\mathbf{e}} \end{aligned} \quad (\text{A.56})$$

and therefore:

$$\hat{\mathbf{e}} \times \left( \frac{\mathbf{R}_i}{R_i} + \frac{\mathbf{R}_f}{R_f} \right) = \hat{\mathbf{e}} \times \left( \frac{R_f + R_i}{R_i R_f} \mathbf{R}_i + \frac{R_i L}{R_i R_f} \hat{\mathbf{e}} \right) = \frac{R_f + R_i}{R_i R_f} \hat{\mathbf{e}} \times \mathbf{R}_i, \quad (\text{A.57})$$

since  $\hat{\mathbf{e}} \times \hat{\mathbf{e}} = 0$ . Inserting this into Eqn. (A.55) leads to:

$$\frac{4\pi}{\mu_0 I} \mathbf{B} = f'(\epsilon) \frac{\epsilon}{R_i R_f} \hat{\mathbf{e}} \times \mathbf{R}_i = f'(\epsilon) \frac{\epsilon}{R_i R_f} \hat{\mathbf{e}} \times \mathbf{R}_i \quad (\text{A.58})$$

Next, look at  $f'(\epsilon)$ :

$$f'(\epsilon) = \frac{1 - \epsilon}{1 + \epsilon} \frac{1(1 - \epsilon) - (1 + \epsilon)(-1)}{(1 - \epsilon)^2} = \frac{1 - \epsilon + 1 + \epsilon}{(1 + \epsilon)(1 - \epsilon)} = \frac{2}{1 - \epsilon^2} \quad (\text{A.59})$$

and insert this into Eqn. (A.58):

$$\frac{4\pi}{\mu_0 I} \mathbf{B} = \frac{2\epsilon}{1 - \epsilon^2} \frac{1}{R_i R_f} \hat{\mathbf{e}} \times \mathbf{R}_i \quad (\text{A.60})$$

$$= \frac{2L}{R_i + R_f} \frac{(R_i + R_f)^2}{(R_i + R_f)^2 - L^2} \frac{1}{R_i R_f} \hat{\mathbf{e}} \times \mathbf{R}_i. \quad (\text{A.61})$$

This results in the final expression for the magnetic field:

$$\mathbf{B}(\mathbf{x}) = \frac{\mu_0 I}{4\pi} \frac{2L(R_i + R_f)}{R_i R_f} \frac{1}{(R_i + R_f)^2 - L^2} \hat{\mathbf{e}} \times \mathbf{R}_i. \quad (\text{A.62})$$

## Appendix A.2. Circular Wire Loop

The derivation of the circular wire loop formulas is considered next.

### Appendix A.2.1. Magnetic Vector Potential

It starts at the expression given by Jackson [2] and listed here in Eqn. (41). Normalized coordinates  $(\rho', z')$  as introduced in Eqn. (43) and Eqn. (44) are used to reformulate the expression given by Jackson into the following:

$$A_\varphi(\rho', z') = \frac{\mu_0 I}{\pi} \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \left[ \frac{(2 - k^2)\mathcal{K}(k) - 2\mathcal{E}(k)}{k^2} \right]. \quad (\text{A.63})$$

A normalizing prefactor is split off according to Eqn. (55). The remaining term  $\tilde{A}_\varphi(\rho', z')$  only depends on the geometry of the wire loop and the evaluation location:

$$\tilde{A}_\varphi(\rho', z') = \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \left[ \frac{(2 - k^2)\mathcal{K}(k) - 2\mathcal{E}(k)}{k^2} \right]. \quad (\text{A.64})$$

Cancellations can happen in the numerical evaluation of Eqn. (A.64) [3]. Therefore, another form for  $\tilde{A}_\varphi(\rho', z')$  can be found by employing formulas from Ref. [13] (Section V.B.11 on page 73 therein):

$$\begin{aligned}\mathcal{K}(k) &= \mathcal{E}(k) + k^2 \mathcal{D}(k) \\ \Leftrightarrow \mathcal{D}(k) &= \frac{\mathcal{K}(k) - \mathcal{E}(k)}{k^2}\end{aligned}\tag{A.65}$$

$$\begin{aligned}2\mathcal{D}(k) &= \mathcal{K}(k) + k^2 \mathcal{C}(k) \\ \Leftrightarrow k^2 \mathcal{C}(k) &= 2\mathcal{D}(k) - \mathcal{K}(k) \\ &= 2 \left( \frac{\mathcal{K}(k) - \mathcal{E}(k)}{k^2} \right) - \mathcal{K}(k) \\ &= \frac{(2 - k^2)\mathcal{K}(k) - 2\mathcal{E}(k)}{k^2}.\end{aligned}\tag{A.66}$$

It is notes that the corresponding expression for  $\mathcal{C}$  given in Eqn. (12) of Ref. [11] has a the wrong sign. Application of Eqn. (A.66) to Eqn. (A.64) leads to:

$$\tilde{A}_\varphi(\rho', z') = \frac{k^2}{\sqrt{z'^2 + (1 + \rho')^2}} \mathcal{C}(k).\tag{A.67}$$

This is the far-field method used in Eqn. (58). Note that  $\mathcal{C}(k)$  can be evaluated as follows [14, 3]:

$$\begin{aligned}\mathcal{C}(k) &= \text{cel2} \left( \frac{2\sqrt{|k_c|}}{1 + |k_c|}, 0, \frac{2}{(1 + |k_c|)^3} \right) \\ &= \text{cel} \left( \frac{2\sqrt{|k_c|}}{1 + |k_c|}, 1, 0, \frac{2}{(1 + |k_c|)^3} \right).\end{aligned}\tag{A.68}$$

The absolute value around  $k_c$  is otherwise omitted in this work because  $k_c \geq 0$  always holds for the formulation of  $k_c$  used in this work. Eqn. (A.63) is a linear combination of the complete elliptic integrals of the first and second kind and can be handled by the `cel` function introduced by Bulirsch [3]:

$$\lambda \mathcal{K}(k) + \mu \mathcal{E}(k) = \text{cel}(k_c, 1, \lambda + \mu, \lambda + \mu k_c^2).\tag{A.69}$$

Here,  $\lambda = (2 - k^2)/k^2$  and  $\mu = -2/k^2$ , leading to:

$$\begin{aligned}\lambda + \mu &= \frac{2 - k^2}{k^2} - \frac{2}{k^2} \\ &= \frac{2 - k^2 - 2}{k^2} = -1 \\ \lambda + \mu k_c^2 &= \frac{2 - k^2}{k^2} - \frac{2(1 - k^2)}{k^2} \\ &= \frac{2 - k^2 - 2 + 2k^2}{k^2} = 1\end{aligned}\tag{A.70}$$

Putting things together, this implies:

$$\frac{(2 - k^2)\mathcal{K}(k) - 2\mathcal{E}(k)}{k^2} = \text{cel}(k_c, 1, -1, 1).\tag{A.71}$$

Thus,  $\tilde{A}_\varphi(\rho', z')$  can be expressed as follows:

$$\tilde{A}_\varphi(\rho', z') = \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \text{cel}(k_c, 1, -1, 1).\tag{A.72}$$

This is equivalent to Eqn. (3.2.1.6) in Ref. [4]. The near-field (close to  $\rho' = 1$ ) is handled by normalizing terms to  $\rho' - 1$ :

$$\tilde{A}_\varphi(\rho', z') = \frac{1}{|\rho' - 1| \sqrt{\left(\frac{z'}{\rho' - 1}\right)^2 + \left(1 + \frac{2}{\rho' - 1}\right)^2}} \text{cel}(k_c, 1, -1, 1).\tag{A.73}$$

Introduce  $n$  and  $m$  with:

$$n \equiv \frac{z'}{\rho' - 1}\tag{A.74}$$

$$m \equiv \frac{\rho' + 1}{\rho' - 1} = 1 + \frac{2}{\rho' - 1}\tag{A.75}$$

where the following was used:

$$\frac{\rho' + 1}{\rho' - 1} = \frac{\rho' - 1 + 2}{\rho' - 1} = 1 + \frac{2}{\rho' - 1}.\tag{A.76}$$

This implies:

$$\tilde{A}_\varphi(\rho', z') = \frac{1}{|\rho' - 1| \sqrt{n^2 + m^2}} \text{cel}(k_c, 1, -1, 1).\tag{A.77}$$

and

$$k_c^2 = \frac{\left(\frac{z'}{\rho'-1}\right)^2 + \left(\frac{\rho'-1}{\rho'-1}\right)^2}{\left(\frac{z'}{\rho'-1}\right)^2 + \left(\frac{\rho'+1}{\rho'-1}\right)^2} = \frac{n^2 + 1}{n^2 + m^2}. \quad (\text{A.78})$$

The formulation presented in Eqn. (A.73) is used in Eqn. (60). It remains to derive the special case formulation used in Eqn. (62) for  $\rho' = 1$ . First, it is noted that inserting  $\rho' = 1$  into  $k_c^2$  from Eqn. (49) leads to:

$$k_c^2 = \frac{z'^2}{z'^2 + 4}. \quad (\text{A.79})$$

This implies the following form of the factor in front of cel in Eqn. (A.72) for the case of  $\rho' = 1$ :

$$\frac{1}{\sqrt{z'^2 + 4}} = \frac{k_c}{|z'|}. \quad (\text{A.80})$$

It follows [3]:

$$\begin{aligned} \tilde{A}_\varphi(\rho' = 1, z') &= \frac{k_c}{|z'|} \text{cel}(k_c, 1, -1, 1) \\ &= \frac{k_c}{|z'|} \int_0^{\pi/2} \frac{\sin^2(\varphi) - \cos^2(\varphi)}{\sqrt{\cos^2(\varphi) + k_c^2 \sin^2(\varphi)}} d\varphi \\ &= \frac{1}{|z'|} \int_0^{\pi/2} \frac{\sin^2(\varphi) - \cos^2(\varphi)}{\sqrt{\sin^2(\varphi) + \frac{1}{k_c^2} \cos^2(\varphi)}} d\varphi. \end{aligned} \quad (\text{A.81})$$

A change of variables is performed from  $\varphi$  to  $\beta = \varphi - \pi/2 \Leftrightarrow \varphi = \beta + \pi/2$ :

$$\begin{aligned} &\int_0^{\pi/2} \frac{\sin^2(\varphi) - \cos^2(\varphi)}{\sqrt{\sin^2(\varphi) + \frac{1}{k_c^2} \cos^2(\varphi)}} d\varphi \\ &= \int_{-\pi/2}^0 \frac{\sin^2(\beta + \pi/2) - \cos^2(\beta + \pi/2)}{\sqrt{\sin^2(\beta + \pi/2) + \frac{1}{k_c^2} \cos^2(\beta + \pi/2)}} d\beta. \end{aligned} \quad (\text{A.82})$$

The shift in the arguments to sin and cos are incorporated according to:

$$\cos(\beta + \pi/2) = -\sin \beta \quad (\text{A.83})$$

$$\sin(\beta + \pi/2) = \cos \beta. \quad (\text{A.84})$$

This leads to:

$$\begin{aligned} & \int_{-\pi/2}^0 \frac{\sin^2(\beta + \pi/2) - \cos^2(\beta + \pi/2)}{\sqrt{\sin^2(\beta + \pi/2) + \frac{1}{k_c^2} \cos^2(\beta + \pi/2)}} d\beta \\ &= \int_{-\pi/2}^0 \frac{\cos^2(\beta) - \sin^2(\beta)}{\sqrt{\cos^2(\beta) + \frac{1}{k_c^2} \sin^2(\beta)}} d\beta. \end{aligned} \quad (\text{A.85})$$

The limits of the integral are swapped and a negative sign is introduced in order to compensate this:

$$\frac{1}{|z'|} \int_{-\pi/2}^0 \frac{\cos^2(\beta) - \sin^2(\beta)}{\sqrt{\cos^2(\beta) + \frac{1}{k_c^2} \sin^2(\beta)}} d\beta = \frac{-1}{|z'|} \int_0^{-\pi/2} \frac{\cos^2(\beta) - \sin^2(\beta)}{\sqrt{\cos^2(\beta) + \frac{1}{k_c^2} \sin^2(\beta)}} d\beta. \quad (\text{A.86})$$

Another change of variables  $\varphi = -\beta$  is performed. This integrand is even-symmetric and thus, the change of variables leads to the following expression:

$$\frac{-1}{|z'|} \int_0^{-\pi/2} \frac{\cos^2(\beta) - \sin^2(\beta)}{\sqrt{\cos^2(\beta) + \frac{1}{k_c^2} \sin^2(\beta)}} d\beta = \frac{1}{|z'|} \int_0^{\pi/2} \frac{\cos^2(\varphi) - \sin^2(\varphi)}{\sqrt{\cos^2(\varphi) + \frac{1}{k_c^2} \sin^2(\varphi)}} d\varphi. \quad (\text{A.87})$$

Note that the negative sign at the front has been incorporated into the sign change of the integration differential. This result can now be evaluated using cel again:

$$\tilde{A}_\varphi(\rho' = 1, z') = \frac{1}{|z'|} \text{cel} \left( \frac{1}{k_c}, 1, 1, -1 \right). \quad (\text{A.88})$$

This is the formulation used in Eqn. (62).

### *Appendix A.2.2. Magnetic Field*

The cylindrical components of the magnetic field are computed from  $\mathbf{B} = \nabla \times \mathbf{A}$ . The magnetic vector potential  $\mathbf{A}$  only has a tangential component  $A_\varphi$ .

This implies that the magnetic field only has components in radial ( $B_\rho$ ) and vertical ( $B_z$ ) direction:

$$B_\rho = -\frac{\partial A_\varphi}{\partial z} \quad (\text{A.89})$$

$$B_z = \frac{1}{\rho} \frac{\partial(\rho A_\varphi)}{\partial \rho} = \frac{A_\varphi}{\rho} + \frac{\partial A_\varphi}{\partial \rho}. \quad (\text{A.90})$$

The chain rule is applied to the partial derivatives of  $A_\varphi$  in order to take derivatives with respect to the normalized coordinates  $\rho' = \rho/a$  and  $z' = z/a$ , where  $a$  is the radius of the wire loop:

$$\frac{\partial A_\varphi}{\partial \rho} = \frac{\partial A_\varphi}{\partial \rho'} \frac{\partial \rho'}{\partial \rho} = \frac{1}{a} \frac{\partial A_\varphi}{\partial \rho'} \quad (\text{A.91})$$

$$\frac{\partial A_\varphi}{\partial z} = \frac{\partial A_\varphi}{\partial z'} \frac{\partial z'}{\partial z} = \frac{1}{a} \frac{\partial A_\varphi}{\partial z'}. \quad (\text{A.92})$$

This implies:

$$B_\rho = -\frac{1}{a} \frac{\partial A_\varphi}{\partial z'} \quad (\text{A.93})$$

$$B_z = \frac{1}{a} \left( \frac{A_\varphi}{\rho'} + \frac{\partial A_\varphi}{\partial \rho'} \right). \quad (\text{A.94})$$

The form of  $A_\varphi$  from Eqn. (55) is inserted into these expressions for the magnetic field components:

$$B_\rho = -\frac{1}{a} \frac{\partial}{\partial z'} \left( \frac{\mu_0 I}{\pi} \tilde{A}_\varphi \right) = -\frac{\mu_0 I}{\pi a} \frac{\partial \tilde{A}_\varphi}{\partial z'} \quad (\text{A.95})$$

$$B_z = \frac{1}{a} \left( \frac{\mu_0 I}{\pi} \frac{\tilde{A}_\varphi}{\rho'} + \frac{\partial}{\partial \rho'} \left( \frac{\mu_0 I}{\pi} \tilde{A}_\varphi \right) \right) = \frac{\mu_0 I}{\pi a} \left( \frac{\tilde{A}_\varphi}{\rho'} + \frac{\partial \tilde{A}_\varphi}{\partial \rho'} \right). \quad (\text{A.96})$$

This allows to define normalized components of the magnetic field:

$$B_\rho = \frac{\mu_0 I}{\pi a} \tilde{B}_\rho \quad (\text{A.97})$$

$$B_z = \frac{\mu_0 I}{\pi a} \tilde{B}_z \quad (\text{A.98})$$

with

$$\tilde{B}_\rho = - \frac{\partial \tilde{A}_\varphi}{\partial z'} \quad (\text{A.99})$$

$$\tilde{B}_z = \frac{\tilde{A}_\varphi}{\rho'} + \frac{\partial \tilde{A}_\varphi}{\partial \rho'}. \quad (\text{A.100})$$

Five derivatives are required in order to formulate the expressions for  $B_\rho$  and  $B_z$ . They originate from the chain rule and the product rule applied in Eqn. (A.99) and Eqn. (A.100) to the formulation of  $\tilde{A}_\varphi$  in Eqn. (A.72). First, consider the partial derivatives of the factor in front of cel:

$$\begin{aligned} \frac{\partial}{\partial z'} \left( \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \right) &= \frac{\partial}{\partial z'} [z'^2 + (1 + \rho')^2]^{-1/2} \\ &= -\frac{1}{2} [z'^2 + (1 + \rho')^2]^{-3/2} 2z' \\ &= \frac{-z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \end{aligned} \quad (\text{A.101})$$

and

$$\begin{aligned} \frac{\partial}{\partial \rho'} \left( \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \right) &= \frac{\partial}{\partial \rho'} [z'^2 + (1 + \rho')^2]^{-1/2} \\ &= -\frac{1}{2} [z'^2 + (1 + \rho')^2]^{-3/2} 2(1 + \rho') \\ &= \frac{-(1 + \rho')}{[z'^2 + (1 + \rho')^2]^{3/2}}. \end{aligned} \quad (\text{A.102})$$

The denominator of the integrand in  $\text{cel}(k_c, 1, -1, 1)$  is reformulated:

$$\begin{aligned} \text{cel}(k_c, 1, -1, 1) &= \int_0^{\pi/2} \frac{\sin^2 \varphi - \cos^2(\varphi)}{\sqrt{\cos^2(\varphi) + k_c^2 \sin^2(\varphi)}} d\varphi \\ &= \int_0^{\pi/2} \frac{\sin^2 \varphi - \cos^2(\varphi)}{\sqrt{1 - k^2 \sin^2(\varphi)}} d\varphi \end{aligned} \quad (\text{A.103})$$

by using

$$\begin{aligned}
\cos^2(\varphi) + k_c^2 \sin^2(\varphi) &= \cos^2(\varphi) + (1 - k^2) \sin^2(\varphi) \\
&= \underbrace{\cos^2(\varphi) + \sin^2(\varphi)}_{=1} - k^2 \sin^2(\varphi) \\
&= 1 - k^2 \sin^2(\varphi).
\end{aligned} \tag{A.104}$$

The parameter of  $\text{cel}(k_c, 1, -1, 1)$  only appears in the denominator of the integrand. This implies that it suffices to compute the derivative of the denominator in order to compute the derivative of  $\text{cel}(k_c, 1, -1, 1)$ :

$$\begin{aligned}
\frac{\partial}{\partial(k^2)} \left( \frac{1}{\sqrt{1 - k^2 \sin^2(\varphi)}} \right) &= \frac{\partial}{\partial(k^2)} [1 - k^2 \sin^2(\varphi)]^{-1/2} \\
&= -\frac{1}{2} [1 - k^2 \sin^2(\varphi)]^{-3/2} [-2 \sin^2(\varphi)] \\
&= \frac{1}{2} \frac{\sin^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}}.
\end{aligned} \tag{A.105}$$

It follows:

$$\frac{\partial}{\partial(k^2)} \text{cel}(k_c, 1, -1, 1) = \frac{1}{2} \int_0^{\pi/2} \frac{[\sin^2 \varphi - \cos^2(\varphi)] \sin^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi. \tag{A.106}$$

The derivatives of  $k^2$  (see Eqn. (48)) are as follows:

$$\frac{\partial(k^2)}{\partial z'} = \frac{2z'k^2}{z'^2 + (1 + \rho')^2} \tag{A.107}$$

$$\frac{\partial(k^2)}{\partial \rho'} = \frac{1}{z'^2 + (1 + \rho')^2} [4 - k^2 2(1 + \rho')] \tag{A.108}$$

$$= \frac{2[2 - k^2(1 + \rho')]}{z'^2 + (1 + \rho')^2}. \tag{A.109}$$

The next step is to use above five derivatives in deriving the expressions for the normalized cylindrical magnetic field components. First,  $\tilde{B}_\rho$  is handled:

$$\begin{aligned}
\tilde{B}_\rho &= -\frac{\partial \tilde{A}_\varphi}{\partial z'} = -\frac{\partial}{\partial z'} \left( \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \text{cel}(k_c, 1, -1, 1) \right) \\
&= -\left\{ \frac{\partial}{\partial z'} \left( \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \right) \text{cel}(k_c, 1, -1, 1) \right. \\
&\quad \left. + \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \frac{\partial [\text{cel}(k_c, 1, -1, 1)]}{\partial(k^2)} \frac{\partial(k^2)}{\partial z'} \right\} \\
&= \frac{z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \text{cel}(k_c, 1, -1, 1) \\
&\quad + \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \frac{2z'k^2}{z'^2 + (1 + \rho')^2} \frac{1}{2} \int_0^{\pi/2} \frac{[\sin^2 \varphi - \cos^2(\varphi)] \sin^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi \\
&= \frac{z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \int_0^{\pi/2} \frac{\sin^2 \varphi - \cos^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}} \left[ \cancel{1 - k^2 \sin^2(\varphi)} + \cancel{k^2 \sin^2(\varphi)} \right] d\varphi \\
&= \frac{z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \int_0^{\pi/2} \frac{\sin^2 \varphi - \cos^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi \\
&= \frac{z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \text{cel}(k_c, k_c^2, -1, 1). \tag{A.110}
\end{aligned}$$

This is the normalized form of the expression for  $B_\rho$  given in Eqn. (3.2.2.4) in Ref. [4]. It is now transformed into a different formulation, which forms the basis for the formulas for  $B_\rho$  presented in this work. It holds:

$$\text{cel}(k_c, k_c^2, -1, 1) = \int_0^{\pi/2} \frac{\sin^2 \varphi}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi - \int_0^{\pi/2} \frac{\cos^2 \varphi}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi. \tag{A.111}$$

The summands in this equation are reformulated separately. The first term is transformed using the integral (2.584.40) from Ref. [12]:

$$\int_0^{\pi/2} \frac{\sin^2 \varphi}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi = \frac{1}{k_c^2 k^2} \mathcal{E} - \frac{1}{k^2} \mathcal{K} \quad (\text{A.112})$$

with shorthand notations  $\mathcal{E} = \mathcal{E}(k)$  and  $\mathcal{K} = \mathcal{K}(k)$ . The second term is transformed using the integral (2.584.42) from Ref. [12]:

$$\int_0^{\pi/2} \frac{\cos^2 \varphi}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi = \frac{1}{k^2} \mathcal{K} - \frac{1}{k^2} \mathcal{E}. \quad (\text{A.113})$$

It follows:

$$\begin{aligned} \text{cel}(k_c, k_c^2, -1, 1) &= \frac{1}{k_c^2 k^2} \mathcal{E} - \frac{1}{k^2} \mathcal{K} - \frac{1}{k^2} \mathcal{K} + \frac{1}{k^2} \mathcal{E} \\ &= \frac{1}{k_c^2} \left[ \frac{1 + k_c^2}{k^2} \mathcal{E} - \frac{2k_c^2}{k^2} \mathcal{K} \right] \\ &= \frac{1}{k_c^2} \left[ \frac{2 - k^2}{k^2} \mathcal{E} - \frac{2 - 2k^2}{k^2} \mathcal{K} \right] \\ &= \frac{1}{k_c^2} \left[ \left( \frac{2}{k^2} - 1 \right) \mathcal{E} + \left( 2 - \frac{2}{k^2} \right) \mathcal{K} \right] \\ &= \frac{1}{k_c^2} \left[ 2\mathcal{K} - \mathcal{E} - 2 \frac{\mathcal{K} - \mathcal{E}}{k^2} \right] \\ &= \frac{1}{k_c^2} [2\mathcal{K} - \mathcal{E} - 2\mathcal{D}] \end{aligned} \quad (\text{A.114})$$

with  $\mathcal{D} = \mathcal{D}(k)$ . This allows to write  $\tilde{B}_\rho$  as follows:

$$\tilde{B}_\rho = \frac{z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \frac{1}{k_c^2} [2\mathcal{K} - \mathcal{E} - 2\mathcal{D}]. \quad (\text{A.115})$$

Furthermore, it is noted that:

$$\begin{aligned} 2\mathcal{K} - \mathcal{E} - 2\mathcal{D} &= k^2 \left[ \frac{\mathcal{K} - \mathcal{E}}{k^2} - \frac{2\mathcal{D} - \mathcal{K}}{k^2} \right] \\ &= k^2 (\mathcal{D} - \mathcal{C}). \end{aligned} \quad (\text{A.116})$$

This is used to write  $\tilde{B}_\rho$  as follows:

$$\begin{aligned}\tilde{B}_\rho &= \frac{z'}{[z'^2 + (1 + \rho')^2]^{3/2}} \frac{k^2}{k_c^2} (\mathcal{D} - \mathcal{C}) \\ &= \frac{4\rho' z' (\mathcal{D} - \mathcal{C})}{[z'^2 + (1 + \rho')^2]^{3/2} [z'^2 + (1 - \rho')^2]}.\end{aligned}\quad (\text{A.117})$$

This is the form of  $\tilde{B}_\rho$  used in Eqn. (69). The near-field formulation is obtained from this by normalizing to  $\rho' - 1$ :

$$\tilde{B}_\rho = \frac{4\rho' \frac{z'}{|\rho'-1|} (\mathcal{D} - \mathcal{C})}{(\rho' - 1)^4 \left[ \left( \frac{z'}{\rho'-1} \right)^2 + \left( 1 + \frac{2}{\rho'-1} \right)^2 \right]^{3/2} \left[ \left( \frac{z'}{\rho'-1} \right)^2 + 1 \right]}.\quad (\text{A.118})$$

This formulation cannot be used at  $\rho' = 1$  close to the wire loop due to the vanishing denominator in that case. Thus, one more formulation is required for  $\tilde{B}_\rho$ . The derivation starts from Eqn. (A.115) and  $\rho' = 1$  is inserted:

$$\begin{aligned}\tilde{B}_\rho &= \frac{z'}{[z'^2 + 4]^{3/2}} \frac{z'^2 + 4}{z'^2} [2\mathcal{K} - \mathcal{E} - 2\mathcal{D}] \\ &= \frac{1}{z'^2 \sqrt{1 + 4/z'^2}} [2\mathcal{K} - \mathcal{E} - 2\mathcal{D}]\end{aligned}\quad (\text{A.119})$$

Furthermore:

$$\begin{aligned}2\mathcal{K} - \mathcal{E} - 2\mathcal{D} &= 2\mathcal{K} - \mathcal{E} - 2 \frac{\mathcal{K} - \mathcal{E}}{k^2} \\ &= \left( 2 - \frac{2}{k^2} \right) \mathcal{K} + \left( \frac{2}{k^2} - 1 \right) \mathcal{E} \\ &= \left( 2 - \frac{2(z'^2 + 4)}{4} \right) \mathcal{K} + \frac{2(z'^2 + 4) - 4}{4} \mathcal{E} \\ &= \frac{4 - z'^2 - 4}{2} \mathcal{K} + \frac{2z'^2 + 8 - 4}{4} \mathcal{E} \\ &= -\frac{1}{2} z'^2 \mathcal{K} + \frac{1}{2} (z'^2 + 2) \mathcal{E}.\end{aligned}\quad (\text{A.120})$$

This allows to write:

$$\tilde{B}_\rho = \frac{1}{2} k_c \left[ \left( \frac{2}{z'^2} + 1 \right) \mathcal{E} - \mathcal{K} \right].\quad (\text{A.121})$$

This is the formulation used in Eqn. (72).

In order to derive the vertical component of the magnetic field,  $\tilde{B}_z$ , we start again from Eqn. (A.72) for the magnetic vector potential and insert it into Eqn. (A.100):

$$\begin{aligned}
\tilde{B}_z &= \frac{1}{\rho' \sqrt{z'^2 + (1 + \rho')^2}} \text{cel}(k_c, 1, -1, 1) \\
&\quad + \frac{\partial}{\partial \rho'} \left[ \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \text{cel}(k_c, 1, -1, 1) \right] \\
&= \frac{1}{\rho' \sqrt{z'^2 + (1 + \rho')^2}} \text{cel}(k_c, 1, -1, 1) \\
&\quad + \frac{\partial}{\partial \rho'} \left[ \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \right] \text{cel}(k_c, 1, -1, 1) \\
&\quad + \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \frac{\partial}{\partial(k^2)} \text{cel}(k_c, 1, -1, 1) \frac{\partial(k^2)}{\partial \rho'}. \tag{A.122}
\end{aligned}$$

Continuing:

$$\begin{aligned}
\tilde{B}_z &= \frac{1}{\rho' \sqrt{z'^2 + (1 + \rho')^2}} \text{cel}(k_c, 1, -1, 1) \\
&+ \frac{-(1 + \rho')}{[z'^2 + (1 + \rho')^2]^{3/2}} \text{cel}(k_c, 1, -1, 1) \\
&+ \frac{1}{\sqrt{z'^2 + (1 + \rho')^2}} \frac{\Im[2 - k^2(1 + \rho')]}{z'^2 + (1 + \rho')^2} \frac{1}{\Im} \int_0^{\pi/2} \frac{[\sin^2 \varphi - \cos^2(\varphi)] \sin^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi \\
&= \frac{1}{\rho' \sqrt{z'^2 + (1 + \rho')^2}} \left\{ \int_0^{\pi/2} \frac{\sin^2 \varphi - \cos^2(\varphi)}{\sqrt{1 - k^2 \sin^2(\varphi)}} \left[ 1 - \frac{\rho'(1 + \rho')}{z'^2 + (1 + \rho')^2} \right] d\varphi \right. \\
&\quad \left. + \frac{\rho'[2 - k^2(1 + \rho')]}{z'^2 + (1 + \rho')^2} \int_0^{\pi/2} \frac{[\sin^2 \varphi - \cos^2(\varphi)] \sin^2 \varphi}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi \right\} \\
&= \frac{1}{\rho' \sqrt{z'^2 + (1 + \rho')^2}} \int_0^{\pi/2} \frac{\sin^2 \varphi - \cos^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}} \left\{ [1 - k^2 \sin^2(\varphi)] \right. \\
&\quad \left. \left[ 1 - \frac{\rho'(1 + \rho')}{z'^2 + (1 + \rho')^2} \right] + \frac{\rho'[2 - k^2(1 + \rho')]}{z'^2 + (1 + \rho')^2} \sin^2 \varphi \right\} d\varphi. \tag{A.123}
\end{aligned}$$

Consider the part inside  $\{\}$  in the integrand in more detail:

$$\begin{aligned}
& [1 - k^2 \sin^2(\varphi)] \left[ 1 - \frac{\rho'(1 + \rho')}{z'^2 + (1 + \rho')^2} \right] + \frac{\rho' [2 - k^2(1 + \rho')]}{z'^2 + (1 + \rho')^2} \sin^2 \varphi \\
&= 1 - k^2 \sin^2(\varphi) - \frac{\rho'(1 + \rho')}{z'^2 + (1 + \rho')^2} + \cancel{\frac{\rho' k^2(1 + \rho')}{z'^2 + (1 + \rho')^2} \sin^2 \varphi} \\
&\quad + \underbrace{\frac{2\rho'}{z'^2 + (1 + \rho')^2} \sin^2 \varphi}_{=k^2/2} - \cancel{\frac{\rho' k^2(1 + \rho')}{z'^2 + (1 + \rho')^2} \sin^2 \varphi} \\
&= \frac{1}{2} [1 - k^2 \sin^2 \varphi] + \frac{1}{2} - (1 + \rho') \frac{\rho'}{z'^2 + (1 + \rho')^2} \\
&= \frac{1}{2} [1 - k^2 \sin^2 \varphi] + \frac{1}{2} - (1 + \rho') \frac{1}{4} k^2 \\
&= \frac{1}{2} [1 - k^2 \sin^2 \varphi] + \frac{1}{4} [2 - k^2(1 + \rho')] . \tag{A.124}
\end{aligned}$$

Inserting this back into Eqn. (A.123) leads to:

$$\begin{aligned}
\tilde{B}_z &= \frac{1}{\rho' \sqrt{z'^2 + (1 + \rho')^2}} \int_0^{\pi/2} \frac{\sin^2 \varphi - \cos^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}} \\
&\quad \left\{ \frac{1}{2} [1 - k^2 \sin^2 \varphi] + \frac{1}{4} [2 - k^2(1 + \rho')] \right\} d\varphi \\
&= \frac{1}{\rho' \sqrt{z'^2 + (1 + \rho')^2}} \left\{ \frac{1}{2} \int_0^{\pi/2} \frac{\sin^2 \varphi - \cos^2(\varphi)}{\sqrt{1 - k^2 \sin^2(\varphi)}} d\varphi \right. \\
&\quad \left. + \frac{1}{4} [2 - k^2(1 + \rho')] \int_0^{\pi/2} \frac{\sin^2 \varphi - \cos^2(\varphi)}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi \right\} \\
&= \frac{1}{2\rho' \sqrt{z'^2 + (1 + \rho')^2}} \left[ \text{cel}(k_c, 1, -1, 1) \right. \\
&\quad \left. + \frac{1}{2} [2 - k^2(1 + \rho')] \text{cel}(k_c, k_c^2, -1, 1) \right] . \tag{A.125}
\end{aligned}$$

This is the formulation of  $\tilde{B}_z$  given as (3.2.2.6) in Ref. [4] with

$$2 - k^2(1 + \rho') = 2 - k^2 - k^2 \rho' = 1 + k_c^2 - (1 - k_c^2) \rho' . \tag{A.126}$$

It is now shown how this formulation can be transformed into the formulation provided by Walstrom in Eqn. (17) of Ref. [11]. First, consider:

$$\begin{aligned} k^2 &= \frac{4\rho'}{z'^2 + (1 + \rho')^2} \\ \Leftrightarrow \frac{1}{\rho'} &= \frac{4}{k^2} \frac{1}{z'^2 + (1 + \rho')^2}. \end{aligned} \quad (\text{A.127})$$

Inserting this into Eqn. (A.125) leads to:

$$\begin{aligned} \tilde{B}_z &= \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \frac{2}{k^2} \left\{ -\rho' \frac{k^2}{2} \text{cel}(k_c, k_c^2, -1, 1) \right. \\ &\quad \left. + \text{cel}(k_c, 1, -1, 1) + \frac{1 + k_c^2}{2} \text{cel}(k_c, k_c^2, -1, 1) \right\} \\ &= \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \left\{ -\rho' \text{cel}(k_c, k_c^2, -1, 1) \right. \\ &\quad \left. + \frac{2}{k^2} \left[ \text{cel}(k_c, 1, -1, 1) + \frac{1 + k_c^2}{2} \text{cel}(k_c, k_c^2, -1, 1) \right] \right\} \end{aligned} \quad (\text{A.128})$$

Using Eqn. (A.114), this is rewritten has:

$$\begin{aligned} \tilde{B}_z &= \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \left\{ -\rho' \frac{1}{k_c^2} [2\mathcal{K} - \mathcal{E} - 2\mathcal{D}] \right. \\ &\quad \left. + \frac{2}{k^2} \left[ \text{cel}(k_c, 1, -1, 1) + \frac{1 + k_c^2}{2} \text{cel}(k_c, k_c^2, -1, 1) \right] \right\} \end{aligned} \quad (\text{A.129})$$

$$\begin{aligned} &= \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \frac{1}{k_c^2} \left\{ -\rho' [2\mathcal{K} - \mathcal{E} - 2\mathcal{D}] \right. \\ &\quad \left. + \frac{2k_c^2}{k^2} \left[ \text{cel}(k_c, 1, -1, 1) + \frac{1 + k_c^2}{2} \text{cel}(k_c, k_c^2, -1, 1) \right] \right\}. \end{aligned} \quad (\text{A.130})$$

Consider the following:

$$\begin{aligned} \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \frac{1}{k_c^2} &= \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \frac{z'^2 + (1 + \rho')^2}{z'^2 + (1 - \rho')^2} \\ &= \frac{1}{\sqrt{z'^2 + (1 + \rho')^2} [z'^2 + (1 - \rho')^2]}. \end{aligned} \quad (\text{A.131})$$

This leads to:

$$\begin{aligned} \tilde{B}_z &= \frac{1}{\sqrt{z'^2 + (1 + \rho')^2} [z'^2 + (1 - \rho')^2]} \left\{ -\rho' [2\mathcal{K} - \mathcal{E} - 2\mathcal{D}] \right. \\ &\quad \left. + \frac{2k_c^2}{k^2} \underbrace{\left[ \text{cel}(k_c, 1, -1, 1) + \frac{1 + k_c^2}{2} \text{cel}(k_c, k_c^2, -1, 1) \right]}_{\equiv (*)} \right\}. \end{aligned} \quad (\text{A.132})$$

Consider (\*) alone for now and use Eqn. (A.71) and Eqn. (A.114):

$$\begin{aligned} (*) &= \frac{k_c^2}{k^2} [2 \text{cel}(k_c, 1, -1, 1) + (1 + k_c^2) \text{cel}(k_c, k_c^2, -1, 1)] \\ &= \frac{1}{k^4} \{ 2(1 - k^2) [(2 - k^2)\mathcal{K} - 2\mathcal{E}] + k^2(2 - k^2) [2\mathcal{K} - \mathcal{E} - 2\mathcal{D}] \} \\ &= \frac{1}{k^4} \{ k^4 \mathcal{E} \} = \mathcal{E}. \end{aligned} \quad (\text{A.133})$$

It follows:

$$\tilde{B}_z = \frac{\mathcal{E} + \rho' [\mathcal{E} - 2\mathcal{K} + 2\mathcal{D}]}{\sqrt{z'^2 + (1 + \rho')^2} [z'^2 + (1 - \rho')^2]}. \quad (\text{A.134})$$

This is equivalent to the formulation presented in Eqn. (17) of Ref. [11], which also is the formulation used to compute  $\tilde{B}_z$  in Eqn. (80) of this work. This is normalized to  $\rho'^2$  in the following for evaluation at large values of  $\rho'$ . First consider the terms in the denominator of Eqn. (A.134):

$$\begin{aligned} \frac{1}{\rho'^2} [z'^2 + (1 + \rho')^2] &= \frac{1}{\rho'^2} (z'^2 + 1 + 2\rho' + \rho'^2) \\ &= \frac{z'^2 + 1}{\rho'^2} + 1 + \frac{2}{\rho'} = t_1 + t_2 \\ \frac{1}{\rho'^2} [z'^2 + (1 - \rho')^2] &= \frac{1}{\rho'^2} (z'^2 + 1 - 2\rho' + \rho'^2) \\ &= \frac{z'^2 + 1}{\rho'^2} + 1 - \frac{2}{\rho'} = t_1 - t_2 \end{aligned} \quad (\text{A.135})$$

with

$$t_1 \equiv \frac{z'^2 + 1}{\rho'^2} + 1 \quad (\text{A.136})$$

$$t_2 \equiv \frac{2}{\rho'}. \quad (\text{A.137})$$

It follows:

$$\tilde{B}_z = \frac{\mathcal{E} + \rho' [\mathcal{E} - 2\mathcal{K} + 2\mathcal{D}]}{\sqrt{t_1 + t_2}(t_1 - t_2)\rho'^3} \quad (\text{A.138})$$

and with Eqn. (A.116) we arrive at:

$$\tilde{B}_z = \frac{\mathcal{E} + \rho' k^2 [\mathcal{C} - \mathcal{D}]}{\sqrt{t_1 + t_2}(t_1 - t_2)\rho'^3}. \quad (\text{A.139})$$

Furthermore, it holds:

$$\begin{aligned} \rho' k^2 &= \rho' \frac{4\rho'}{z'^2 + (1 + \rho')^2} \\ &= 4 / \left\{ \frac{1}{\rho'^2} [z'^2 + (1 + \rho')^2] \right\} \\ &= 4 / \left[ \left( \frac{z'}{\rho'} \right)^2 + \left( \frac{1 + \rho'}{\rho'} \right)^2 \right] = 4 / \alpha_{\text{cd}} \end{aligned} \quad (\text{A.140})$$

with

$$\begin{aligned} \alpha_{\text{cd}} &= \frac{z'^2}{\rho'^2} + \frac{1 + 2\rho' + \rho'^2}{\rho'^2} \\ &= \frac{1}{\rho'^2} [\rho'^2 + 2\rho' + 1 + z'^2] \\ &= 1 + \frac{1}{\rho'} \left[ 2 + \frac{1}{\rho'} (1 + z'^2) \right]. \end{aligned} \quad (\text{A.141})$$

Putting things back together, we arrive at:

$$\tilde{B}_z = \frac{1}{\sqrt{t_1 + t_2}(t_1 - t_2)\rho'^3} \left[ \mathcal{E} + \frac{4(\mathcal{C} - \mathcal{D})}{1 + \frac{1}{\rho'} \left[ 2 + \frac{1}{\rho'} (1 + z'^2) \right]} \right]. \quad (\text{A.142})$$

This is the formulation used in Eqn. (81) of this work. One more formulation of  $\tilde{B}_z$  is required for this work. The derivation starts at Eqn. (A.129), which is reformulated using Eqn. (A.133) and Eqn. (A.114) as follows:

$$\begin{aligned}
\tilde{B}_z &= \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \frac{1}{k_c^2} [\mathcal{E} - \rho' (2\mathcal{K} - \mathcal{E} - 2\mathcal{D})] \\
&= \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \left[ \frac{1}{k_c^2} \mathcal{E} - \rho' \frac{1}{k_c^2} (2\mathcal{K} - \mathcal{E} - 2\mathcal{D}) \right] \\
&= \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \left[ \frac{1}{k_c^2} \mathcal{E} - \rho' \operatorname{cel}(k_c, k_c^2, -1, 1) \right]. \tag{A.143}
\end{aligned}$$

Integral (2.584.37) from Ref. [12] is used as follows:

$$\begin{aligned}
\frac{1}{k_c^2} \mathcal{E} &= \int_0^{\pi/2} \frac{1}{[1 - k^2 \sin^2(\varphi)]^{3/2}} d\varphi \\
&= \operatorname{cel}(k_c, k_c^2, 1, 1). \tag{A.144}
\end{aligned}$$

It follows:

$$\tilde{B}_z = \frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} \operatorname{cel}(k_c, k_c^2, 1 + \rho', 1 - \rho'). \tag{A.145}$$

This is the formulation of  $\tilde{B}_z$  consistent with Eqn. (14) of Ref. [11]. The terms in Eqn. (A.145) are now normalized to  $\rho' - 1$  for use close to the wire loop. Then:

$$\begin{aligned}
\frac{1}{[z'^2 + (1 + \rho')^2]^{3/2}} &= |\rho' - 1|^{-3} \left[ \left( \frac{z'}{\rho' - 1} \right)^2 + \left( \frac{\rho' + 1}{\rho' - 1} \right)^2 \right]^{-3/2} \\
&= |\rho' - 1|^{-3} [n^2 + m^2]^{-3/2} \tag{A.146}
\end{aligned}$$

Putting things back together, we arrive at:

$$\tilde{B}_z = \frac{1}{|\rho' - 1|^3 [n^2 + m^2]^{3/2}} \operatorname{cel}(k_c, k_c^2, 1 + \rho', 1 - \rho') \tag{A.147}$$

with  $k_c = \sqrt{k_c^2}$  and  $k_c^2$  from Eqn. (A.78). This is the formulation used in Eqn. (87) of this work. Above expression cannot be used to compute  $\tilde{B}_z$

close to the wire loop at  $\rho' = 1$ . Therefore, one final special-case formulation is required. The derivation starts again with Eqn. (A.145) and  $\rho' = 1$  is inserted. This leads to:

$$\tilde{B}_z = \frac{1}{[z'^2 + 4]^{3/2}} \text{cel}(k_c, k_c^2, 2, 0) \quad (\text{A.148})$$

with

$$k_c^2 = \frac{z'^2}{z'^2 + 4} . \quad (\text{A.149})$$

This is the formulation used in Eqn. (85) of this work.

## Appendix B. Reference Data

Reference outputs have been computed using the `mpmath` Python package [5]. The reference implementation was tested at a subset of the test points against Mathematica [6]. The results are listed in Table B.1.

Table B.1: Reference outputs for testing an implementation of Eqn. (108), computed using arbitrary-precision arithmetic. The displayed values for  $A_\varphi$  are rounded to the nearest 64-bit `double` precision value (IEEE 754).
